#### **ACKNOWLEDGEMENTS**

I am indebted to many people, instructors, colleagues, and the staff members at the Cyprus Turkish Airlines in the completion of this paper. They have all made significant contributions to the supplimentary materials that were used during my work on this paper.

I appreciate the support provided by Chairman of the Business Administration Department Assist. Prof. Dr. Erdal Güryay and my supervisor Assist. Prof. Dr. Okan Safaklı.

I wish to greatfully acknowledges the Marketing Instuctor Mr. Ahmet Ertugan for his significant contributions.

I am specially indebted to my family and wish to express my warm thanks to them.

#### **ABSTRACT**

This paper aimed to investigate and demonstrate the role of information technology in gaining company competitive advantage.

Literature defined competitive advantage as arising from a match between a firm's distinctive competencies and the factors critical for success within its industry. "When a company achieves this match, it will deliver superior perceived value relative to company must have a clear understanding of three things: its distinctive competencies, the industry in which it competes, and the overall business environment. If a firm's distinctive competencies allow it attain the low-cost position in its industry, it cannot afford to lose ground to rivals seeking to leapfrog it. If a company competes via differentiation, it must be continually innovate to maintain or enhance the perceived uniqueness of its products. Beyond this, it is necessary for a company to assess costumer perceptions.

Use of Porter Models throught the paper demonstrated that Information Technology assists in gaining competitive advantage at every segment of the value chain and by affecting the forces of competition.

CTA was used as a case study. The failure of CTA on gaining a competitive advantage from Information Technology applications was explained as information systems and general business-related issues and management authority and responsibility.

# THE EFFECTS OF INFORMATION TECHNOLOGY (IT) ON COMPETITIVE ADVANTAGES: THE CASE OF CYPRUS TURKISH AIRLINES (CTA)

#### **CHAPTER I**

#### 1. INTRODUCTION

In seeking success, managers are especially aware of the influence of the firm's environment. The firm is connected to the elements in its environment by flows of both physical and conceptual resources. Firms attempt to gain a competitive advantage by managing the resources flows, including those of information. The firm's information resources include more than the information itself. They also include hardware, facilities, software, data, information specialists, and users of the information.

Managers on all levels engage in planning, but the plans of the top-level managers extend far into the future. These strategic plans identify what the firms is to achieve five, ten, or more years in the future and spell out how these objectives are to be met. As the executives prepare the strategic plans for the firm, similar plans are made for each of its business areas. Business area strategic plans describe how each of these areas will contribute to the achievement of the firm's objectives.

The activity of identifying the information resources that the firm will need in the future, acquiring those resources, and managing them is called strategic planning for information resources (SPIR), SPIR is a responsibility of all managers, but the managers of the information services organization plays the key role. The title CIO, for chief information officer, is often used for the top information services manager.

Of all the recent innovations in computer use, none has had a greater impact than enduser computing. End users are now developing many of their own applications. This trend will continue and will produce overall benefits of the firm, although not without some serious risks. The risk can be minimized through proper management controls. When the firms managers recognize information as a strategic resource, establish policies to apply that resource in a strategic way, and follow up to ensure that the policies are carried out, the activity is called information resources management, or IRM. IRM is a concept that integrates the other concepts of Competitive Advantage, Chief Information Officer, and Strategic Planning for Information Resources, and enduser computing. As such, IRM provides a framework for effective computer use.

#### 1.1 Competitive Advantage

A firm can achieve competitive advantage in many ways, such as by providing products and services at a low price, providing products and services that are better than those of the competitors and meeting the special needs of certain market segments. In the computer field, competitive advantage refers to the use of information to gain leverage in the marketplace. The firm does not have to rely entirely on superior physical resources when engaged in competition. Rather, superior conceptual resources-data and information-can be used well. The firm managers use conceptual as well as physical resources in meeting the strategic objectives of the firm.

#### 1.2 Information Technology

Information technology is more than just computers. It must be conceived of broadly to encompass the information businesses create and use as well as a spectrum of increasingly convergent and linked technologies that process the information. An important concept that highlights the role of information technology is the "value chain". This concept divides a company's activities into the technologically and economically distinct activities it performs to do business (marketing and delivery to buyers, support and servicing after sale, installation, repair, and parts inventory management, for example). Information Technology is permeating the value chain, transforming the way value activities are performed and the nature of the linkages among them. Every value activity creates and uses information of some kind. A

logistics activity, for example, uses information like scheduling promises, transportation rates, and production plans to ensure timely and cost-effective delivery. Information technology is also affecting competitive scope and reshaping the way products meet buyer needs.

Information is changing the rules of competition in three ways:

- 1. Advances in technology are changing industry structure,
- 2. Companies are using IT to create competitive advantage,
- 3. It is spawning completely new businesses. Senior executives need to:
- Assess information intensity,
- Determine the role of information technology in industry structure,
- Identify and rank the ways in which information might create competitive advantage,
- Investigate how information technology might spawn new businesses, and
- Develop a plan for taking advantage of information technology.

#### CHAPTER 2

#### 2. PROBLEM SITUATION

#### 2.1 Problem

The main theme of this paper is to try to explain "How IT is used as a competitive weapon for new business creation and changing the rules of the game in existing business". We are using Information Technology, in every part of our lives; at work, at educational establishments and at homes, but we don't know much about it. What is Information Technology? How can we use it to gain competitive advantage? Competitive advantage grows fundamentally out of the ability of a firm in creating value for its customers. The generic competitive strategies are defined as the search for a favourable competitive position within the industry and the choices are cost leadership, differentiation, focus or getting stuck in the middle.

#### 2.2 Research Objectives

The main area of interested of this research was to explain and demonstrate to link between the firm's competitive advantage and Information Technology (IT) use as usually described in literature.

The following questions were set as research questions throughout the assignment.

- What is competitive advantage?
- What are the theories and models behind the competitive advantage of companies?
- What is Information Technology?
- What are the benefits of Information Technology to firms?
- How does Information Technology contribute to firm's competitive advantage throughout the value chain?

#### 2.3 Methodology

Apart from scanning the relevant literature on the subject the main methodology used was the case study method. Namely, Cyprus Turkish Airways, was picked as the case study company because of its being a national company with data relatively more available.

The steps in the methodology involved,

- 1. Literature search on the theories and models of competitive advantage and Information Technology.
- 2. Michael E. Porter's models were used to demonstrate the link between competitive advantage and Information Technology within the case study.

#### **CHAPTER 3**

#### 3. COMPETITIVE ADVANTAGE AND INFORMATION TECHNOLOGY

Competitive advantage is defined as arising from a match between a firm's distinctive competencies and the factors critical for success within its industry. "When a company achieves this match, it will deliver superior perceived value relative to company must have a clear understanding of three things: its distinctive competencies, the industry in which it competes, and the overall business environment. If a firm's distinctive competencies allow it to attain the low-cost position in its industry, it cannot afford to lose ground to rivals seeking to leapfrog it. If a company competes via differentiation, it must be continually innovate to maintain or enhance the perceived uniqueness of its products. Beyond this, it is necessary for a company to assess costumer perceptions.

In the 1960s and 1970s, when many definitions of organizational technology were being developed. IT was largely nonexistent with computers being almost entirely confined to the world of mainframes and backroom functional applications. Technology was conceptualised in terms of technical complexity (Woodward, 1965); operations technology and variability (Pugh, Hickson, Hinings & Turner, 1969: Hickson, Pugh & Pheysey, 1969); interdependence (Thompson, 1967): routine-nonroutine (Perrow, 1967, 1970), and manageability of raw materials (Mohr. 1971). Following Perrow's (Perrow, 1967) suggestion, we propose that technology should be viewed broadly as the process of managing the uncertainty and risk surrounding the transactions necessary to convert inputs into outputs (Thompson, 1967). Given that today IT has become a primary means of managing and reducing the uncertainties surrounding production and administrative processes we see technology and T as inextricably linked.

Theoretically it has been noted that IT must be tightly coupled with strategy (e.g., Holland, Lockett & Blackman, 1992; Porter & Millar, 1985) because IT affects strategy and strategies have IT implications (e.g., Bakos & Teachy, 1986), yet theoretical or empirical treatment of the way IT moderates the effects of strategy on organizational outcomes such as efficiency and innovation or performance in general has not been a recent focus in top management journals. This is somewhat surprising given that IT can

instrumental in both shaping core capabilities and integrating capabilities into the organization context making them apparent at all organizational levels (Ciborra & Lanzara, 1990). Moreover, IT capabilities can be difficult to imitate since they are not present in physical information systems, but in the organization specific information technologies developed inside the organization over time.

Competitive positioning and the ability to pursue a low cost and/or differentiation strategy ultimately depend on a firm' s ability to increase efficiency, quality, innovation, and customer responsiveness (Porter, 1996; Prahalad & Hamel, 1990). Since IT moderates the way strategy affects performance, the implications of different forms of IT for both the pursuit of a strategy and for determining its effectiveness deserves consideration. For example, one advantage of IT is knowledge leveraging (Venkatraman, 1994), which involves sharing and integrating cross-functional expertise through appropriate forms of technology. Benefits from knowledge leveraging include the development of synergies and delivery to customers of value-added services and products, which in turn may result in competitive advantage in the form of product or service differentiation.

Santos, Peffers & Mauer, 1993), several authors have suggested that actual returns to organizations from investment in IT are not sufficient to back up claims of their performance-enhancing advantages. Despite broad claims by experts like Greenspan (2000) that the performance gains-from both efficiency and innovation-that stem from IT are one major cause of record firm-profits in the 1990s, some suggest that there is little evidence that investments in new IT applications have a positive impact on internal measures of firm performance such as market share or profitability (Dos Santos & Peffers, 1995) and that these dollars might be better spent elsewhere (Baily & Chakrabarti, 1988; Roach, 1987).

#### **CHAPTER 4**

#### 4 PORTER MODELS THEORIES

#### **4.1 Porter Competitive Model**

The Porter Competitive Model shown in Figure 4.1 is used to understand and evaluate the structure of an industry's business environment and the threats of competition to specific company. A benefit of its use is that it helps to avoid viewing a company's competitive environment too narrowly. The use of the model duplicates the same logistic that an engineer would follow. It breaks an industry into logical parts, analyses each part and puts the parts back together within the industry's structure.

It should be noted that this model was not developed specifically for analysing the competitive role of information systems. It is a broad analytical tool used by people who run entire business or major functions within a business to assess competitive position. Thinking competitively is essential to assessing the competitive role of information systems, since strategy should dictate how information systems should be used. At the same time, information systems make new strategies and new ways of competing possible.

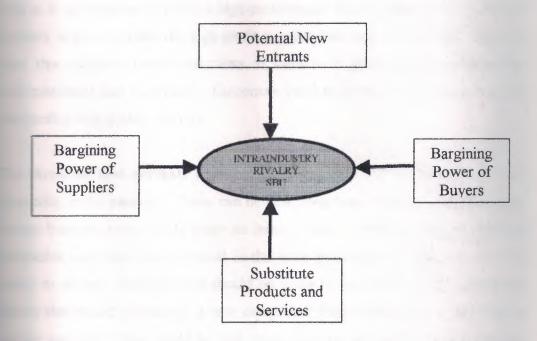

Specifically the model can be used to identify whether information technology can:

- Build barriers to prevent a company from entering an industry.
- Build in cost that would make it difficult for a customer to switch to another suppliers.
- Change the basis for competition within the industry:
- Change the balance of power in the relationship that a company has with customers or suppliers.
- Provide the basis for new products and services, new markets or other new business opportunities.

Forer tells us that competition in an industry is based on five forces, as shown in force 4.1.

industry rivalry is the logical and necessary starting point in understanding industry. It deals with the nature and degree of competition among companies the same industry. To reach this level of understanding requires an analysis of industry size, structure, market and financial performance, dominant industry size, structure, strategies, critical core competencies, global industry, recent or impending trends and anything else that would implicantly impact a company within the industry.

Figure. 4.1 Porter Competitive Model

Porter, Michael E., Competitive Strategy, New York: The Free Press, 1980. p,4.

services within the industry. Identifying customers is often easy but sometimes more difficult than might be expected. Is a company truly a customer an intermediary? Are there multiple tires of customers, as in the airline industry with its travel agents and passengers? A major consideration is whether the customer has significant power, why this power exists and what benefits this accrues to them.

The bargaining power of suppliers refers to the key providers of products and services that contribute to the competitive posture of companies within the industry. Again, it is important to assess any power implications. Does the supplier provide a unique or scarce product of service that cannot be duplicated from another company? Intel is an excellent example of a supplier with power as long as it can continue to provide high-performance microprocessors. This power certainly helps to explain the high profit margins that Intel has realized. Keep in mind that suppliers have motivations to maintain a good business relationship with customers and vice versa. Customers need to work at maintaining a good relationship with quality vendors.

The threat of new entrants represents the likelihood that additional will start competing in the industry. These can be new companies, existing companies that change business strategies to enter an industry that is new to them, or existing companies that have not competed in the same geographic or product area but exide to do so. Consideration should be given to barriers to entry. Are there extors that would discourage a new competitor from entering the industry or a existing customer to change to the new entrant company. Barriers to exist, to stop to business in an industry, can also serve as a barrier to entry.

The final force in the model is the threat of substitute products or services that would be viable alternatives to those offered by companies in the industry. Consideration should be given to the substitutes and why buyers would find them attractive.

To establish a strategic agenda a company, identified as the strategic business unit, must understand how the five forces work in the industry and how they affect the company in its particular situation. Assessing the competitive risks is the first step in developing a competitive strategy, which will lead to tactics that will enable to company to realize its goals. Information systems are a potential key ingredient in this process. It is necessary to understand both the industry-level changes that can be bought about the developing information systems and the potential impact on the company.

#### 4.2 The Strategic Business Unit and Competitive Strategies

The strategic business unit, the company being analysed, has two basic objectives:

- I To create effective links with buyers (customers) and suppliers.
- 2 To build barriers to new entrants and substitute products or services.

understand the position of the strategic business unit within the industry requires an understanding of the intra-industry rivalry. This dictates an electronic description of the strategies of the major companies that are rivals of the electronic description and low cost. Every company must pick either one or the other as a similarly strategy.

#### 4.2.1 Differentiation Strategy

A differentiation strategy separates a company from its competitors by selection one or more needs that are valued by the customer and uniquely meeting these needs through superior performance. This approach should selectively add cost if necessary to do so. The ultimate reward to the companies that successfully implement a differentiation strategy is the ability to charge premium prices.

The sustaining of differentiation strategy depends on the durability of the difference as perceived by the customer. Multiple source of differentiation obviously helps. The ability to sustain this strategy also ties to whether the differentiated product has a cost advantage. It is important to remember that a differentiation strategy is usually costly. Common pitfalls in differentiation include:

- Falling to meet customer expectations regarding value
- Looking too narrowly for sources of differentiation
- Charging an excessive price premium
- Falling to understand the costs of differentiation
- Ignoring changing signals from customers regarding value
- Creating differentiation that is easily duplicated by competitors

#### **4.2.2 Low-Cost Strategy**

A low-cost strategy means that cost is the primary factor on which a strategy will be based. In pursuing this strategy it is important to remember the following points.

- There is only one winner in a least-cost competition.
- The sustainability of a cost advantage depends on the cost drivers underlying it.
- Multiple source of cost advantage increase its sustainability.

- Primary low-cost sources include economies of scale, tight cost control in all facets of the business, proprietary knowledge and process, unique linkages and alliances that are consistent with this strategy.
- Cost reduction must be emphasized in most, if not all, functions within the organization.
- Information system can be exploited to accomplish cost reduction.

A low-cost strategy can be sustained if better than average return can be reinvested in improved facilities, equipment and process.

#### **4.2.3 Supporting Strategies**

In addition to the two basic strategies, there are three strategies that can support them. They are innovation, growth and alliance. A company can elect to pursue none of these, all of them or combinations of these supporting strategies.

Innovation Differentiation through innovation is a common combination of a basic and supporting strategy. It would be accurate to say that Charles Schwab's strategy was differentiation, growth and innovation. Innovation was based on its ability to provide computer —based applications in support of the other two strategies.

Growth Size can be necessary factor for company to sustain its business strategies and achieve success. Federal Express is a good example of a company with a strategy that needed to realize package volume growth to justify the large amount of capital equipment involved in its delivery network.

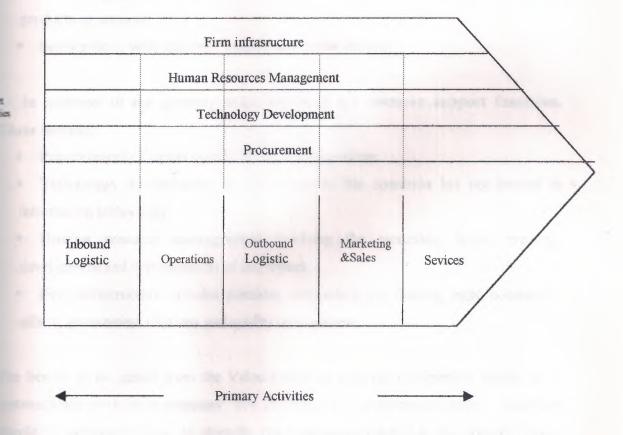

Alliance No one says that a company must do everything itself. Alliances that really work are difficult to establish but can be used to support a strategy that otherwise would be impossible to implement. The airlines use alliances to implement and operate passenger reservation systems.

#### 4.3 Porter's Value Chain

Unlike the Competitive Model, it focuses internally within an organization. It was developed as a strategic method for examining all the activities a firm performs and how they interact, as a basis for analysing the sources of competitive advantage. The relevant level for constructing a Value Chain is a firm's activities in a particular industry. The complete generic value chain is depicted in Figure 4.2.

Figure 4.2

#### Generic Value Chain

Source: Porter, Michael E., Competitive Advantage, New York: The Free Press, 1985, p.33.

It is important to remember that the Value Chain is a structure. The actual contents of a Value Chain for a specific company determine a source of competitive advantage.

There are five primary activities involved in competing in any industry, as shown Figure 4.2. Each category is made up of multiple activities that depend on the company, its strategies and the industry in which it competes. The primary activities include:

- Inbound logistics involves receiving, storing and disseminating inputs to the product.
- Operations transform inputs into the final product.
- Outbound logistics collects, stores and physically distributes the product to customers.
- Marketing and sales identifies markets and how customers buy the company's products or services.
- Service deals with customer support and repair service.

In addition to the primary activities there are common support functions.

These include:

- Procurement of inputs used in the firm's value chain.
- Technology development in every facet of the operation but not limited to information technology.
- Human resource management involving the recruiting, hiring, training, development and compensation of employees.
- Firm infrastructure includes planning, accounting and finance, legal, community affairs, government relations and quality management.

The benefit to be gained from the Value Chain, as with the Competitive Model, is to systematically evaluate a company' key processes and core competencies. Attention should be particularly given to strenghs and weaknesses relative to the primary factors that would contribute to the company's ability to compete. It is important to identify discrete activities as well as where these activities can be linked. How one activity is performed affects the cost and performance of another. Established effective links among key activities can be a powerful source of competitive advantage.

#### CHAPTER 5

#### 5. AIRLINE INDUSTRY ANALYSIS

#### 5.1 Description of the Industry

The airline industry is an important component of today's global economy. Over 1,25 billion passengers per year rely on the world's airlines for business and vocation travel. Approximately a quarter of the world's manufactured exports by value are transported by air. Since the first jet airliner flew in 1949, use of commercial aviation has expanded more than 65 times.

The industry is mature but is still changing and growing. The passenger segment of the airline industry is the largest. In 1995 it accounted for over \$69 billion in revenues of 73,7 percent of the industry's total revenues. Over major segments include freight and express (9 percent), charter (3,5 percent), and mail (1,3 percent). Economically, the airline industry is an imperfect oligopoly, in which a few carriers dominate in long-haul passenger traffic. Several dozen small carriers compete for short-haul flights. The Department of Transportation in US classifies air carriers by the size of their revenue base. In the United States, 34 carriers have a fleet of 25 or more aircraft.

Major Airlines: Annual revenues exceed \$1 billion; American, United, Delta, Northwest, Southwest, and US Airlines, Each have fleets of 300 or more aircraft.

National Airlines: Annual revenues are between \$100 million and \$1 billion; more regional in focus with smaller seating capacities.

Regional Airlines: Annual revenues are less than \$100 million; commuter lines and start-up carriers.

Airline industry demand is cyclical. Travel generally follows economic activity. Economic models for forecasting airline traffic are commonly based on projections for gross domestic product (GDP), disposable personal income, and consumer confidence levels. While air traffic volume reflects economic factors, the cost and convenience of alternative models of transportation also impact air traffic. Demand for discretionary

travel, such as vacations, tends to be more prices sensitive. In recent years, corporate travel budgets have also become price sensitive. High fares stifle air traffic demand, while low fares spur grater demand.

#### 5.2 Potential /Prospective for Growth

The airline industry remains one of the fasted growing sectors of the world economy. Passengers and freight traffic is expected to increase at an average annual rate of 5 to 6 percent between 1997 and 2010. This is significantly greater than the expected growth of global GDP. By 2005, the number of people travelling by air is projected to exceed 2,5 billion a year. Growth in air travel will be led by the Asia market. Demand for this region is anticipated to grow by an average of 8,6 percent annually between now and 2010.

#### **5.3 Competitive Structure**

Ten major airlines (airlines with annual revenues over \$1 billion) currently account for over 75 percent of all operating revenue and 90 percent of passenger revenue. The other 10 percent are made up of over 100 airlines. The market share of other airlines has been increasing at the expense of the major airlines.

The competitiveness in the airline industry was enhanced by deregulation in 1978. Deregulation allowed airlines to fly wherever they wished. It also allowed new small airlines to compete with the existing major airlines. Some small airlines have done well with point-to-point, short-haul, and high frequency operations.

Airlines do not sell a tangible product but are simply suppliers of transportation. Aside from certain frills, the service airlines provide is basically undifferentiated. Some of these frills are more legroom, better food, newer movies, telephone service, and most recently hook-ups for fax and online communication. Frequent flyer programs and rewards are also used to distinguish airlines from their peer.

Passenger pricing has become more and more transparent, particularly due to consumer access to fares on the Internet. In sum, the airline industry is highly competitive.

Besides competing with each other on service and price, airlines compete with variety of transportation modes, including automobiles, railroads, and buses. Airlines use frequent flyer programs to build brand loyalty and distinguish themselves from the competition. Frequency flyer programs have been developed in an attempt to gain customer loyalty and promote repeat business. Frequent flyers represent only 8 percent of the total number of passengers. The miles they fly equal 45 percent of all miles flown. Satisfying these passengers can be key to an airline's success.

### 5.4 Technological Investment And Analysis

Technology presents a tremendous potential to cut costs and simplify the process of air travel. The airline industry has improved its operating efficiency by applying new information and communication technologies. Staffing levels can be cut because computer, modems, and ATM-like machines enable fast and efficient communication and ticket distribution.

In 1995, airlines established home pages on the World Wide Web. These sites display information about schedules and fleets, contain financial and promotional material, give listing of in-flight movie offerings, and let travellers check the status of their frequent flyer accounts. Since 1996, ticket less travel enabled ticket purchases to be made on the web. Once the reservation paid for, passengers can board the airline by showing a valid driver's license. This eliminates the security surrounding ticket stock as well as the accounting procedures required to tract the use tickets.

In 1997, 2 percent of air travel reservations were made through Internet bookings. As travellers use the Internet to obtain frequently sought information, airlines are cutting customer service operations. The Internet makes airfares publicly available and comparable on the World Wide Web, This enables consumers to compare and shop for the lower price.

Airlines are using technology to reduce operating costs. Early in 1995, the airline industry realized the partial elimination of the traditional paper ticket. The "electronic ticket" was its replacement. It brings significant savings to airlines in the cost of ticket distribution. Whether passengers welcome the change is not entirely clear.

The airline **smart card** is another new product. It provides frequent travellers with the ability to quickly identify them, board a flight, obtain a ticket, and pay for other products and services. It also saves airline ticket distribution costs, allows more passengers use of self-service facilities, and provides a better means of identification.

Most major airlines are part of an intricate computer system that enables travel agents to book flights for customers. Major airlines are able to offer a high concentration and variety of flights with availability. This makes it easier for agents to schedule. In addition, major airlines are able to offer more incentives to travel agents who sell the airline seats.

#### 5.5 Importance of Information Technology Applications to Airlines

Information technology plays a major role in almost every aspect of the operation of an airline because of the high information content. Volumes of data on passengers, flights, meals, etc. need to be processed.

At the mention of the airline industry and computers, most people think of passenger reservation systems. While these passenger service systems are significant, they are not the only important computer application within most airlines. Sophisticated operational information systems are required to effectively manage equipment, personnel, flight scheduling and contingency planning. Yield management is critical to the profitability of most airlines. This involves analysis of demand versus capacity on every flight with pricing decisions make accordingly. Flight operating systems involve a computer in the cockpit of the airplane that deals with throttle setting for take-off, weather conditions while en route and gate assignments upon arrival.

#### 5.6 Benefits of Information Technology System

Convenience to Customers This has been the primary motivation for the passenger reservation systems. This ability to make a reservation for an entire trip, be assigned a seat, receive a boarding pass to eliminate standing in line, request a rental a hotel in multiple cities, arrange for a special meal and conveniently change your plans before or during the trip, are all examples of benefits made possible by this type of system.

Knowledge of Customers This benefit was gained through the frequent-flyer program Advantage. The airline wanted to know whom its better customers and tried to increase the loyalty of these passengers by rewarding them for the amount of business they did with the airline. From a data-gathering standpoint the program work very well. Most passengers get upset if they do not receive frequent-flyer points; so they carefully identify themselves when take a trip. Although a large number of people signed up for the program the loyalty factor has not been as successful as they had hoped. People who fly a great dial tend to take the first available flight to their next destination.

Providing a Foundation for Other Systems This was a major benefit of the computer reservation system. The data regarding both the better customers and all passengers is used to analyse the logic of routes, frequency of flights, ticket structure and prices. The yield-management system mentioned previously is a key factor in realizing a profit for the airline. A typical flight can have as many as fifteen to seventeen differently priced tickets. The yield-management system deals with how many tickets in each category should be sold for each flight. A key consideration is how many tickets to hold until the last minute to accommodate business travellers who would be charged at a higher rate.

Building a Base for Other Business In an age when innovation, efficiency and up-to-date technology are important business success factors, AMR's information and management-services business provide a significant competitive advantage (AMR 1993 Annual Report, p.25). These information systems capabilities within have been marketed by American to other airlines and businesses in general. They designed and built a reservation system for the French railroad and Aeroflot in Russia. In addition to

consulting and systems design they provide telemarketing services, system training, ground services and investment services.

The challenge for the airline industry in general, as it relates to information technology is to keep pace with data management requirements that are increasing significantly on an annual basis, while maintaining the system reliability required to compete.

#### 5.7 Successful Airlines and Information Technology Applications

While most airlines in the world recorded major losses from 1990 through 1993, there have been four consistently profitable carriers, Singapore Airline, British Airways, Southwest Airlines and Cathay Pacific.

Apart from good strategic management in creating customer value on improved customer services, Aircraft utilization and cost saving reservations all these airline companies are known to have been pioneers in Information Technology applications. For example, they have implemented a strategy to provide an infrastructure that includes excellent information technology and telecommunication networks, worldwide distribution linkages and a total value chain to support a diversity of manufacturing and service business.

#### CHAPTER 6

#### 6. CASE STUDY (CYPRUS TURKISH AIRLINES)

#### 6.1 History of Cyprus Turkish Airlines (CTA)

The Cyprus Turkish Airlines (CTA) was established on 4 Dec. 1974 with its Head Quarters in Nicosia, TRNC. The initiating capital was 40,000,000 TL (6,506,822,40 TL paid). There were two founding shareholders: *Turkish Airlines* (TA), representing the Republic of Turkey with fifty per cent of the shares and 'İnkişaf Sandığı', representing TRNC also with fifty per cent of the shares.

The CTA was declared bankrupt in the middle of 1997 after continued losses over the years. This period is called "Period of Ümit Utku" after the name of the then CTA Director. In 1998, CTA started a new period with an agreement with a different organisation, Turban Ltd., representing the Republic of Turkey. This period is now regarded more successful giving CTA a new technical structure.

#### 6.2 Mission Of The CTA

The mission of CTA is to create an air link for the TRNC with other countries transporting passengers in and out of the country from all over the world. This, however, is a difficult mission to establish given the political situation in Cyprus and the economic embargoes set on the TRNC. After the Greek Coup and the resultant Turkish intervention in 1974 Cyprus was divided in the Greek Cypriot Administration in the South and the Turkish Cypriot Administration in the North. The Turkish Cypriots then founded the Turkish Republic of Northern Cyprus although only recognised by Turkey. The new State had no airlines and the CTA was established with a mission to fulfil this gap.

#### 6.3 CTA Market Segmentation

The market of CTA is divided into two segments related with the type of customers.

- Passengers
- Cargos

#### 1. Passengers

All the TRNC peoples who want to go outside of the country and peoples who want to enter to TRNC with air travel. These customers groups have come into existence:

- Leaders of Government and Businessmen
- People who need medical treatments at developed countries,
- Tourists from Germany and other European Countries
- Turkish Cypriots from Abroad (mainly from London)
- Soldiers of Turkish Military Service whom are in TRNC, and their families. They are using air travel to enter the TRNC and go out side of country reliably, quickly and comfortably.
- Tourists for gambling from Turkey

In recent years, a new business area opened in the TRNC, presenting new market opportunities for the CTA.

There are five private universities (Eastern Mediterranean University, Near East University, International Cyprus University, Lefke European University, and Girne American University) in the TRNC. These universities are the source of potential customers made up of students who are coming to Cyprus for further education; the students' families are also potential customers for the Airline.

#### **Priority Needs of Passengers**

- ✓ Reliability
- √ Punctuality
- ✓ Good ground and flight Services

#### 2. Cargos

Cargo refers to pockets that are under the twenty kilos. These pockets belong to persons or organisations.

#### **Priority Needs of Cargo Customers**

- ✓ Reliability
- ✓ Punctuality
- ✓ Cheap Price

#### 6.4 Political Environment

Because of the political and economic embargoes, air travel to the TRNC is only possible via Turkey. The aeroplanes of the CTA need to land and register at Turkish Airports before flying to other destinations. For example, when flying to U.K. or Germany, CTA has to land and register at a Turkish airport, as Turkey is the only country recognising the TRNC which has legal airports. The same aeroplane coming back to the TRNC, it has to touch down in Turkey again, before come to TRNC. In addition, some countries like France does not even agree to this arrangement. No CTA aeroplane can land in French Airports under any circumstances. These political restrictions play a negative role for CTA's market potential and costs.

In addition, this procedure extends the flying and waiting times thus causing inconvenience for many customers.

When a CTA Airline flies to and back from the U.K. it goes through the following schedules:

From Ercan to Izmir. (The flight has to registered there).

From Izmir to Heathrow (U.K.).

From Heathrow to İzmir (The flight again registered).

From İzmir to Ercan.

If there were no embargoes:

From Ercan to Heathrow.

From Heathrow to Ercan.

This means that the CTA Company has double expenses both in costs and time for checking, personnel, safety, and passenger service operations

#### 6.5 Legal Environment

Cyprus Turkish Airlines is regulated under the International Aviation Law like all other airline organisations. The International Aviation Law can't be local; it is a global law that all airlines organisations must comply in order to fly.

CTA is also regulated under the Laws of the Republic of Turkey under the Civilian Aviation Law. There are two basic aviation laws; Chicago and Varsova.

#### 6.6 Financial Situation

The CTA suffered serious financial losses in the middle of 1997. It was declared bankrupt and than re-established as jointly owned by Turban Ltd, representing Turkey, and by the TRNC. A new executive management was also appointed. This period is more successful and reflects a better financial situation for the CTA. The CTA could

better control their expenses and work for profit. Today, The CTA is regarded as a very efficient airline company in financial terms within the boundaries of Turkey and the TRNC.

The CTA is being affected by the economical crisis that occurred in the TRNC and Turkey with rising foreign exchange rates for the last two years. The numbers of passengers have decreased when compared with the time prior to the crisis. This does not mean, however, that CTA was affected by the crisis in a great deal. CTA carries out all its transactions in USA Dollars isolating itself from the ill effects of the fluctuating exchange rates.

#### 6.7 Competition

Since February 2001 the competitor of CTA was Istanbul Airlines, but now CTA has no competing airlines in Cyprus. Direct competition, however, exists from other providers of travel and freight services, mainly by ferries. Travel by sea to Turkey offers a cheaper alternative for segment of travellers. Most of the commercial freight in and out of Northern Cyprus is also carried this way. However, CTA still enjoy a monopolistic position in the year as a public company with over 700 personnel who are loyal to the company because of the state social security system and other job security measures.

Facing future direct competition, although not possible in the near future, CTA will need to upgrade its competitive advantage through offering a better customer value at a lower cost. The current personnel to passenger ratio is, for example, high undermining CTA's competitiveness.

#### 6.8 Human Resource Management

The CTA has a department for Human Resources Management at its Central Office.

This department has two functions; the recruitment and the training of personnel.

#### 6.9 Contracts with Agents

CTA offers flight tickets for sale at their service points, and through independent Travel Agents. CTA has two type of contracts with travel agents; agents with IATA membership get 9 per cent commission and the non-IATA members get 8 per cent commission on the value of flight tickets sold.

#### 6.10 Information Technology

Before 1997, CTA did not make much use of the modern technology. They were using only few PC's and 10-15 dummy terminals as a system to process data at the Central Office. All documentation was transferred from branches to Central Office in hard copies and was entered to computers collecting all information in digital forum. This process was not efficient; it was very hard and time consuming.

After 1998, CTA started a new period with different organization and different management. This new period brought more technology and efficiency to the CTA. New computer systems were acquired and a new IT system was established. In 1999, the CTA information processing was completely transferred to a computerised system. A Computerised networking system was established such that all CTA branches could share information with each other.

Now, CTA is connected and using local and global network systems, there are four network communications employed for in-office, inter-branch, and global communications with other airlines and services.

## 6.10.1 RAS (Remote Access Server)

The RAS is an offline (non-online) system that is not connecting all time to general system. If any branch want to transfer their accounting information connect to General Office System, they sets their dial-up connection. After, transferring information to RAS that is a server at the General Office, they cut the connection.

The aim of this server, the entering their data to the computer system and when finish the entering they could be transfers their information to the Central Office and the calculation analysed there.

Before many years, the branches was doing all the processing by hand using paper and bill, at the end of the mount they transferred that documentation to the general office. The bills and paper checked there and made documentation.

After, they started to use computer system and the branches entered their information to the computer system, than they take print out the documentations and copy to disk. The copy of the documentations was transferring to the General Office and entering to the computer again there.

But now days they are using more technological computer system. The branches can be translating all the documentations to Central Office by using network system, so there is time consuming and doubly. The information is checked in the General Office.

The information doesn't to transfer the entire server, it's firstly transferring to RAS server, its stored there temporarily, than the information transferred to an Accounting Server because of to overcome the insecurity,

## 6.10.2 Accounting Server

Accounting Server is used by the Accounting Department. The Accounting Server is connecting to the Remote Access Server and receiving the information that transferred from branches. All coming-incoming analysis making Accounting Department by using collected information. This system doesn't connection with other network to security system. They are using the Accounting Programmed to entering their data to the computer system and analysing the information.

#### 6.10.3 Mail Server

This is a local server that is using only in the office to sending and receiving messages to communication the personnel with each other. The personal can be sending the messages and documentations to other personnel and they can receive the messages from others.

### 6.10.4 Sita Server (SITATEX)

All the airlines are using Sita Server to communicate between each other. The Central Office of this system is in the Atlanta. The communication is very important thing for the airlines organizations.

# 6.11 CTA Financial Analysis

The following table represents the Income Analysis of the CTA with Global Industry rates provided for comparison;

# CYPRUS TURKISH AIRLINES 1996-2001 INCOME ANALYSIS (U.S. Dollars)

: Base year

erson David, Managing Information Systems, Prentice Hall,2000

: Cyprus Turkish Airlines.

Financial Data obtained for the CTA between the periods 1995 to 2001 were in Turkish Liras. Since, the Turkish Lira has experienced a downward trend in value against other currencies key income figures were worked out in U.S. Dollars based on the average annual exchange rates provided by the Turkish Republic Central Bank for the years 1996-2001 (See Appendix C). The breakdown amounts of the key income figures were shown as a percentage of sales, indexed to 1995 as the base year (See Appendix B).

The Income Analysis of the CTA carried out in Table 1 shows anomalies both within itself and when compared with Global Average Industry Rates. Clearly, insight present a clear picture on CTA's financial transactions. However, despite many attempts this was not possible as the CTA is a 'closed' organization. It is fair to comment there that CTA needs to be more 'transparent' if its mission is to contribute to the economic welfare of the Turkish Cypriot community as claimed.

Until the year 1999 sales from operations showed very little fluctuation from 1996 sales. However, in the year 2000 there was an increase by 46%. This jump in sales could be explained with the collapse of Istanbul Airlines adding to the market share of the CTA and the increase in the 'gambling tourists' arriving in Northern Cyprus. This exceptional year may help us to understand why the average increase in CTA sales was at 12%, almost as 3 times as the Global rates of 3.6%.

The fall in the cost of sales ratio in 1998 from 124% in 1997 to 55% is an anomaly. When we use examine the break-down of the cost sales in Appendix A, we see that this anomaly has arisen from the costs of fuel and oil, which were more than halved in one year! Clearly, with the rising fuel rates globally, either CTA has discovered a cheaper source of fuel somewhere, or that it was paying more than the market value previously. Despite this, however, the average increase in the cost of sales at CTA stood at 1% in 2001 more efficient than the Global average increase of 3.3 %.

Average gross profit margins stood at 14.19% in 2001, an average increase of 3.21 times as compared with the 3% increase of industry.

Net operation ratio was 7.26 times the -17.24% experienced in 1996 while the industry increase in 2001 was at 2.9%.

Perhaps the anomalies could be explained with the change of management in the late 1990's that lasted until 2001. The media during that period praised management for putting back the CTA into profitability and being able to add more aeroplanes the CTA fleet.

One thing is certain that CTA needs to revise its accounting principles and be more transparent to public seeking information. Only then, we could more rationally analyse its financial performance and on this case to be able to comment on the effects of IT instalment on company profitability.

#### CHAPTER 7

# 7. APPLICATION OF THE PORTER MODELS TO CTA WITH AN IT PERSPECTIVE

# 7.1. Generic Strategies to CTA

Using the Porter Competitive model we can analyse the industry structure, the competitive strategies and the power structure within the airline industry.

CTA is an independent airline with markets in Turkey and Europe. Its routes are described as short-haul with both hub-and-spoke and point-to-point route structures. Being a monopoly in Northern Cyprus, CTA cannot be regarded as a low fare airline. It earns premiums due to its monopolistic position and hot due to any competitive advantage obtained through differentiation.

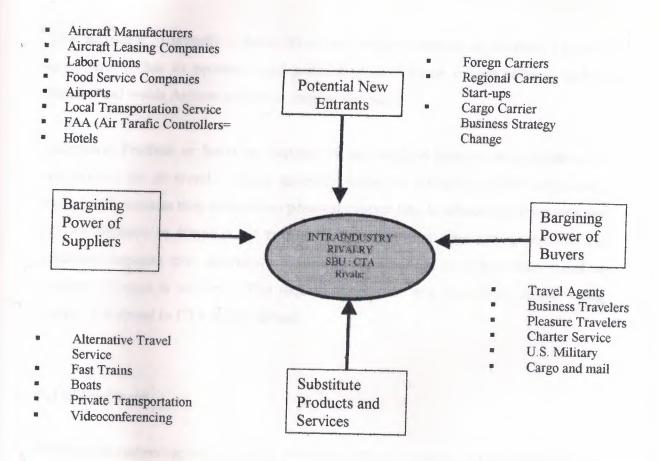

CTA's IT installations have a minor role in company relations. Due to this no cost advantages are obtained either. On Porter's generic strategies we could describe CTA as a company offering a non-differentiated product at a high cost. Clearly, in a competitive market this would be described as an "idiot strategy" (in Porter words) doomed to failure.

# 7.2 Competitive Forces Model to CTA

The application of the complete Porter Competitive Forces Model to the airline industry is shown Figure 7.1 below;

Figure 7.1

# Porter Competitive Model Airline Industry Analysis

Source: Porter, Michael E., based on ideas in Competitive Advantage, New York: The Free Press, 1985.

There are limited forces on the CTA due to its being the only airline flying to and from Northern Cyprus.

CTA buyers: Like all other airlines CTA's passengers are the people who fly for business or personal reasons. In most cases, these individuals would have some power in picking a competitor airline. In CTA's case, however, buyers do not enjoy this power.

CTA suppliers: Suppliers are a significant competitive force in the airline industry. Three deliverables from suppliers-aircraft, fuel and all labour (from unions)-are the most significant determinations in the operating cost of the carriers. The power implications of suppliers in mixed in the industry. CTA is not an exception.

New Entrants: Currently, a threat from new airlines operating in Northern Cyprus is quite remote due to economic and political crises. Some private airlines, such as Istanbul and Noble Airlines are now a thing of the past.

Substitute Product or Services: Analysis of this category requires an examination of the motives for air travel. People generally choose to travel by air for two primary reasons: (1) because they desire more personal contact than is afforded by telephone and (2) the distance to travel is far enough that a significant time savings justifies the additional expense over alternative models of travel. The only substitute travel to Northern Cyprus is via sea. This requires more time and discomfort despite being cheap. The threat to CTA is very limited.

## 7.3 Value Chain

Information technology plays a major role in almost every aspect of the operation of an airline because of the high information content. Volumes of data on passengers, flights, meals, hotels, etc. need to be processed.

At the mention of the airline industry and computers, most people think of passenger reservation system. While these passenger service system are significant, they are not the only important computer application within most airlines. Sophisticated operational information systems are required to effectively manage equipment, personnel, flight scheduling and contingency planning. Yield management is critical to the profitability of most airlines. This involves analysis of demand versus capacity systems involve a computer in the cockpit of the airplane that deals with throttle setting for take-off, weather conditions while en route and gate assignments upon arrival. The Porter Value Chain is shown in Figure 7.2 to graphically explain the scope of IT use;

Logistics

Logistics

and Sales

ucture

urce agement

nology lopment

rement

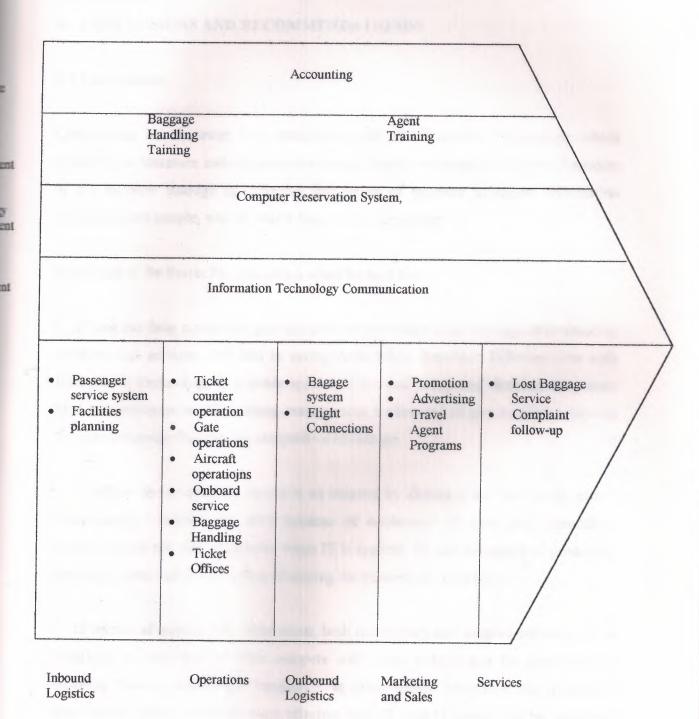

When we examine the CTA, however, we see that IT installations have not been carried out with company competitive advantage or customer value in mind.

Current IT systems, include four different instalments:

- 1. Remote Access Server (RAS): Gathers accounting reservation information from branch and agents at Central Office. (Reservation and Accounting).
- 2. Accounting Server: Receives and processes accounting reservation information from branches.
- 3. Mail Server: Providers communication between personnel members. A sort of an Intranet.
- 4. Sita Servet (SITATEX): Providers communications with other international airlines.

As observed IT installation falls behind industry standarts and therefore does not add much value to the CTA's Value Chain as seen in Figure 7.3 next page;

## **CTA Value Chain**

#### **CHAPTER 8**

#### 8. CONCLUSIONS AND RECOMMENDATIONDS

#### 8.1 Conclusions

Conclusions on theories; The competitive role of Information Technology, which according to literature and experiences of some firms contributes to the overall success of the business through an effective integration of business strategies, information technology and people, was the major focus of this assignment.

In the light of the Porter Models used it could be seen that;

- IT use can help companies gain competitive advantage either through differentiating products and services, and also in saving costs where possible. Differentiation with Information Technology is possible applied to product design and distribution systems filed and processed on IT systems, management is observed to give a quicker respond to customer needs thus gaining competitive advantage.
- IT affects the competitive forces in an industry by changing the "rule of the game" continuously. Barriers to entry because of economies of scale and competitive advantages are not always possible when IT is applied. IT also is capable of producing substitute ideas and products thus enhancing the intensity of competition.
- IT affects all parts of the value chain; both the primary and support activities. It is significant to note that IT must compete with other technologies for prioritisation, including funding, within the company. In other words, sometimes the traditional information systems could be more effective than IT, and IT should not be employed without any consideration. Finally, it was observed that IT has become both a prominent and pervasive tool within most segments of the value chain.

Conclusions on CTA case and Information Technology; In the analysis of the CTA, competitive advantage gained by IT installations during the late 1990's was found to be very low. One could say that there were very little advantage gained from a move from the traditional information systems to IT at the CTA.

There were no extra profits gained. Increase the market share in the last few years was due to some local airlines closing down and not because CTA's gaining competitive advantage of any kind. We may explain the reasons for this lack of performance in two-fold. One, through comparing the IT used at other airlines and the CTA; and two, by looking at the possible failures at the planning stages of IT use.

At the mention of the airline industry and computers, most possible think of passenger reservation systems. This was the case at the CTA. As discussed within the project CTA uses four basic IT systems all aimed at passenger reservations and keeping accounting records. Successful airlines, however, makes further use of IT to gain competitive advantage. While these passenger service systems are significant, they are not the only important computer application within most airlines. operational information systems are required to effectively manage equipment, personnel, flight scheduling, and contingency planning. Yield management is critical to the profitability of most airlines. This involves analysis of demand versus capacity on every flight with pricing decisions made accordingly. Pricing decisions at the traditional methods of looking at the past and cyclical demand. Prices are determined at the beginning of a season thus taking a chance on the event changes in the business environment. Flight operating systems involve a computer in the cockpit of the aeroplane that deals with throttle setting for take-off, weather conditions while en route and gate assignments upon arrival. CTA has no such systems that save costs in operations.

The second main reason of the failed IT use at the CTA could be explained by looking at the planning stages for IT use.

If general business planning can fail produce the desired results, the same can be said for trying to integrate information systems into a business plan. Failure regarding information system at the CTA may fall into two general categories;

- 1. Information systems and general business-related issues. Here, the failure is related to the outcome being stated in technology terms and not business terms. People at the CTA either do not understand or simply do not accept the stated objectives and/or the approach of the company. They may have also failed because of their tendency to place blame on today's environment (Embargos), rather than project the CTA to a new and better way of doing things.
- 2. Management authority and responsibility. Management authority and responsibility factors at the CTA can also be the cause for a lack of IT planning success. These include a failure to support the plan of trying to avoid the results if averse. Clearly CTA's executive with 50% owned by a Turkish Company and the other 50% by Northern Cyprus is not a structure where sound responsibilities and decisions can be taken. Evidence on managerial inadequacies and quarrels are frequently read in the media.

As a result of applying IT to CTA the number of workers should have been reduced, but because of their Labour Union rights this could not be done. In addition to this, the change of government had effects employing more workers.

In general, this project concludes that business strategies do not compete with the use of information systems. The goal is for the business strategy to be successful with the support of the IT. We must keep in mind that business strategies can work without the use of information systems.

Information systems and IT can never be successful as a competitive advantage resource if they do not support the right business strategies.

#### 8.2 Recommendations

In the light of the findings and the conclusions of this paper one could recommend that in order to gain a competitive application from computerized information systems, companies should;

- Ensure that IT planning matches with the business vision, mission and corporate objectives.
- Any IT considerations should be related to convenience and benefits to customers.
   Firms gain competitive advantage when they produce a better customer value than competition.
- IT application and planning should provide a foundation to other systems within current and future company operations.
- IT planning should not be based on mimicking other companies and it should not be carried out in a vacuum. The business should regularly check on its current resources and capabilities against the possible opportunities environment at every stage of IT planning.

#### APPENDIX D

Physical Anchison, Managing Information 3 plans in the Hall 1000.

Chapter 5 Airline Industry 144

as vacations, tends to be more price sensitive. In recent years, corporate travel budgets have also become price sensitive. High fares stifle air traffic demand, while low

fare, spur greater demand.

The federal government has not regulated airlines since deregulation in 1978. Since deregulation, the industry has grown significantly more concentrated. Since 1985, mergers played a significant role in this concentration. Between 1986 and 1987, Texas Air merged with Eastern and People's Express, Northwest Airlines with Republic Airlines, and Delta with Western. Industry consolidation has resulted from slowing traffic growth and the exhaustion of conventional costcutting measures. Mergers offer savings opportunities through the consolidation of administrative, distribution, and maintenance operations. Bankruptcies in the 1990s, most notably Pan American and Eastern, have also led to the consolidation of the industry.

All major airlines with the exception of Southwest operate through hub-and-spoke networks. In a hub system, passengers are gathered from surrounding "spoke" cities to a central hub airport where they must transfer to the second leg of their flight. This enables densities to be built for the longer portion of the flight, better matching equipment to demand. Competitive challenges are rare once an airline is established in a hub. This has led to the stabilization of airfares and

profit margins.

Despite deregulation, the Federal Aviation Administration (FAA) still imposes safety standards on carriers. It certifies aircraft and airlines and establishes age and medical requirements for pilots. A series of tragic airplane crashes in 1996 pushed air safety to the forefront. The crash of a ValuJet airplane in the Florida Everglades in May was followed in July by the mysterious explosion and crash of TWA's Flight 800 over the Atlantic Ocean. The ValuJet crash prodded regulators to tighten their scrutiny of start-up airlines and the practices of maintenance contractors. Certification of a new airline now takes twice as long as before. The number of aircraft that a new airline can operate is also limited based on the carrier's financial and managerial

The Department of Transportation (DOT) levies civil penalties against airlines that engage in fraudulent marketing practices and violate code-sharing rules. It also decides airline ownership and control issues. Internationally, the DOT plays an important role by negotiating bilateral aviation treaties with foreign nations.

#### FINANCIAL ANALYSIS

From 1994 to 1996, the growth rate in the airline industry averaged 6.7 percent each year. In 1997, the growth rate averaged 7.1 percent per year, with an average load

factor of just over 70.6 percent. Compared in other transportation industries, this rate is high, due to the fact that regional and international airlines continue to increase their service to underserved destinations.

The airline industry includes high harriers to entry. It requires a huge capital investment, not only for purchasing aircraft but also for labor, gate fees, advertiing, fuel, etc. Nonetheless, the airline industry is easier to enter now than it was before 1978 when deregulation was passed. Flight equipment accounts for more than 62 percent of total airline assets.

A newer trend for start-ups, as well as major carriers. is to lease rather than buy planes. If aircraft are purchased, tax implications occur such as charges for depreciation and financing costs such as interest in preferred dividend payments. Among major airlines, depreciation averages 4.7 percent. For Southwest Airlines. depreciation increased 4.9 percent compared to an increase in the percentage of owned aircraft.

An important measure is yield, or the revenue generated per passenger mile (RPM). Comparing the absolute yield level for different carriers is only useful if the carriers have a similar mix of flights. Another consideration is revenues from nonfare sources. Since these can account for as much as 10 percent of an airline's total revenues, this contribution can make the difference

between an operating profit and loss. Industry revenues are strongly linked to corporate earnings and disposable income. The second and third quarters, along with holidays, have commonly been the times when demand was highest and operating conditions most favorable. From 1990 to mid-1994, the industry suffered \$12 billion in losses. In the third quarter of 1995, the airline industry reported record profits of nearly \$2.4 billion. Total operating revenues increased by 3.6 percent while total operating expenses increased by 3.3 percent. At the same time, passenger revenues increased by 6.2 percent along with freight and express revenues, which increased by 16.4 percent. The rate of return on investment rose by 6.8 percent. As a result of these factors, the operating profit margin increased by 3.1 percent along with the net profit margin, which increased by 2.9 percent.

The outlook is even more promising for the worldwide airline industry as a whole (Table 5.1). The profits for 1995 reached a net figure of \$5.2 billion dollars. hased on international service revenues of \$129.6 billion. Net profit of 4 percent of revenue set an all-time record for the industry. International revenues for 1996 reached \$140 billion, resulting in a \$6.0 billion net profit or 4.3 percent of revenue. With the airline industry's new profitability, and provided that the airlines continue to focus their efforts on the balance sheets, this industry will become a very attractive investment in the next century.
