Faculty of Engineering

Department of Computer Engineering

**Furniture Market – Furniture Sale And Company
Expences Program**

**Graduating Project
COM 400**

Student: Murat ŞEKERCİ (20011036)

Supervisor : Ümit İLHAN

Lefkosa 2007

ACKNOWLEDGEMENTS

“Firstly I’m greatly indebted to my supervisor Mr. Umid İLHAN, he was so helpful to us, I learned Visual programming language form him, he answered my questions Whenever I had.

Secondly I would like to give my best regards to my family, especially my Mum, she deserved a lot to stay along from me, also I’m greatly indebted to my Dad, however his financial situation was not good first year but he resisted and forced me to continue my studding, he never made me need anyone. Also I thank my elder sisters, they encouraged me all the time to study and continue my duty, and they send me presents sometimes to make me happy.

*Thirdly I thank my friends Metin ULAŞ .Mahmut KÜRŞAT EYİCİ ,Aysun KOCER for their help, they get tired with me, and they helped me and give morale evertime.
I thank them with my all*

*Finally I would like to thank All my friends here in Cyprus and In Turkey especially Aysun KOCER, she helped me morally and made me resist to continue and to be
An engineer I thank him very much.*

ABSTRACT

GKM Furniture market Program is a useful program for Furniture Markets. By using this program they can record and control everything happen in the market and company , for instance, selling furniture , buying furniture ...etc.

The program is easy in use, and everything is in detail, I used Visual Basic Programming Language in building it, also Access Database for storing information's. The program records sale operation.Gkm furnitere program has Furniture detail .customer detail, product detal , company detail repors buying and selling detail dept detail payment and expences details.

For every operation we have special form, for instance when we make a sale to a customer, we open sale page. When we buy new furniture for market, we have special page. For adding item's to stock we have special pages too.every operation has speciall pages.

I used many forms in this project, the main form is sale , the program records everything, we can query all the information's at any time, also when he made that sale and paid part of the money either in cash or by credit card or bank account, the program store paid amount and the remaining loan amount to his/her or company account.

Using this program enables the control of stock, control's. In the same time users can't trick the manager, because whatever they do is recording by the program, users can't enter everywhere of the program, they are restricted by some pages, only the manager can enter wherever he wants.

INTRODUCTION

Gkm Furniture Market Program for FURNITURE-MARKET is a world widely used program for professional and big furniture market's, by the way of this program we can arrange everything of the market, if we use the program in a correct way nothing will be confused during any operation that take place in market for present time and future, also we can investigate past sale operations too.

In the first Chapter Visual basic programming language is described, its properties, components and some examples, I used Visual Basic Program in my project, because I find it easy and I liked its coding system. Visual basic for applications delivers a competitive advantage for ISV seeking to provide full customization and integration capabilities to customer.

In the Second Chapter I described Database system, I used Microsoft Access Database system in my program with Visual basic, Advantages of using access is to provide exactly the same options for the problems we write as it does for the problems we selected from a database. Secondly, the process of writing or selecting problems is almost independent of page layout dictations. Also you can see more details about access and SQL.

Third Chapter is Flow Chart of my program, all the operations that take place in the project, decisions...etc. is described in the form of flow chart.

Finally, the last chapter is the explanation of the program followed by the Appendices. So by developing and moderating of technology our program can be developed and updated. Also new properties could be added in to the program in the future.

CHAPTER ONE: VISUAL BASIC

1.1. Introducing Visual Basic

VISUAL BASIC is a high level programming language evolved from the earlier DOS version called BASIC. BASIC means **B**eginners' **A**ll-purpose **S**ymbolic **I**nstruction **C**ode. It is a fairly easy programming language to learn. The codes look a bit like English Language. Different software companies produced different version of BASIC, such as Microsoft QBASIC, QUICKBASIC, GWBASIC ,IBM BASICA and so on.

Firstly, I want to say to you about Visual Basic on the screen. When you apply to it, you will see, VB menu and tools, form, toolbox, properties window, project explorer, form layout and source code window. You can see below clearly.

Nowadays, software is very popular. Many programmers do computer programming. If you are a computer programmer, you can consider visual basic as your language of choice for learning how to develop computer programs. Of course there are other programming language is popular. But, Visual Basic is simple as possible. Because, to learning visual basic is so easy, also to do visual interface, has evolved into a very powerful development tools and fun to use. But programming in Visual Basic is a challenging. That's basic reason is easyness of Visual Basic. Everybody can do program with visual basic easily. All that facilities shows that, someone can learn Visual Basic itself and train it.

Learning Visual Basic is based on only practise. As I said before, it is visual. Directly, you are in an interaction with your graphical user interface. You must not hasitate to try your simple programs, your imagination, try it in Visual Basic programming. As you know, best way to learn Visual Basic is by examples. Also you can find information to learn about visual basic on the internet and can use a best book. Look from there and try what you learn.

Let me remind to you one more things about best programmer. As you estimate, which is to enjoy programming, just be relax and program for fun and treat programming as a hobby. You will be amazed at the progress you make and success.

1.2 The Visual Basic Environment

On start up, Visual Basic 6.0 will display the following dialog box as shown in figure 1.1. You can choose to start a new project, open an existing project or select a list of recently opened programs. A project is a collection of files that make up your application. There are various types of applications we could create, however, we shall concentrate on creating Standard EXE programs (EXE means executable program). Now, click on the Standard EXE icon to go into the actual VB programming environment.

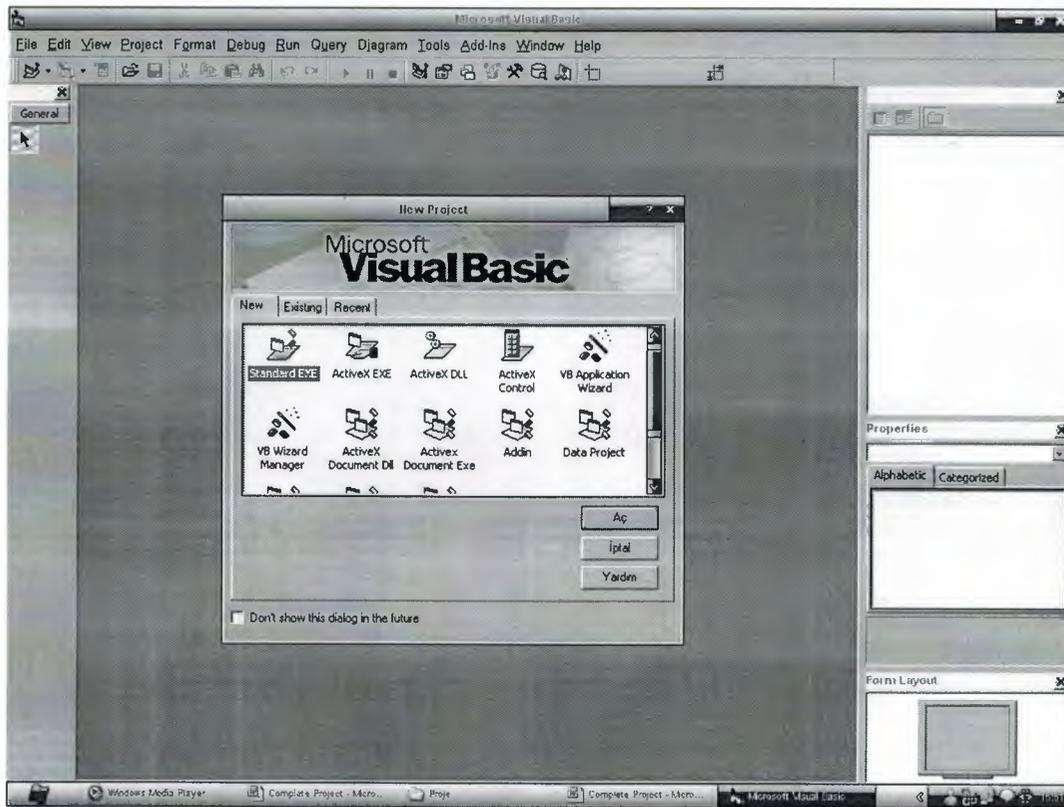

Figure 1.1 The Visual Basic Start-up Dialog Box

In figure 1.2, the Visual Basic Environment consists of the:

- A Blank Form for you to design your application's interface.
- The Project window which displays the files that are created in your application.
- The Properties window which displays the properties of various controls and objects that are created in your applications.

It also includes a Toolbox that consists of all the controls essential for developing a VB Application. Controls are tools such as text box, command button, label, combo box, picture box, image box, timer and other objects that can be dragged and drawn on a form to perform certain tasks according to the events associated with them. Additional objects can be added by clicking on the project item on the menu and click on components on the drop-down list, then select those controls you need to use in your program

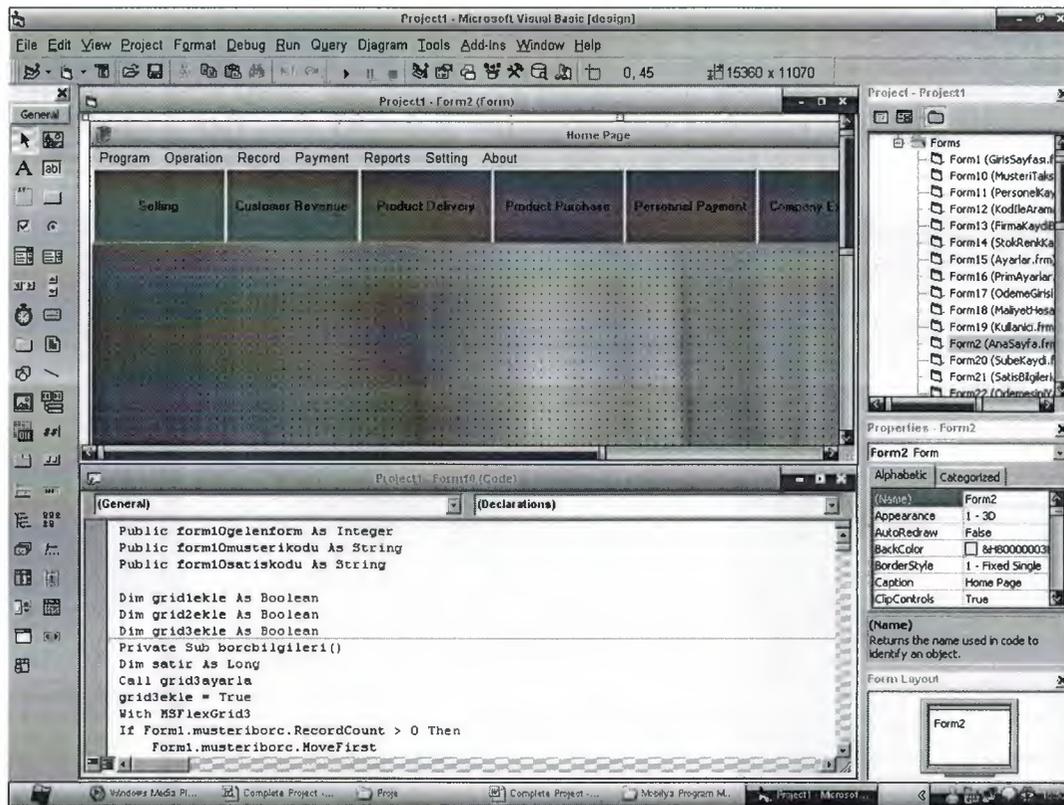

Figure 1.2: The Visual Basic Environment

1.3. Visual Basic For Application

Visual Basic for application provides a complete integrated development environment. It is a powerful development technology for rapidly customizing rich client desktop packaged application and integrating them with existing data and system. VBA offers a sophisticated set of programming tools based on the Microsoft Visual Basic Development system, the worlds most popular rapid application development system, which developers can use to harness the power of packaged applications.

As mentioned before, Microsoft Visual Basic includes many window to facilitate programmers for their application. Which are VB menu and tools, form, toolbox, properties window, project explorer, form layout, debugging tools, and source code window. VBA also include supporting for Microsoft Form, for creating custom dialog boxes, and ActiveX controls for quickly building user interfaces

Software programs, which is include VBA, it is called customizable applications, that can be tailored to fit specific business need. This class of application enables developers to rapidly built solution that require less and user training. For MIS and business managers, customization means that solution can be developed quickly and deployed easily with minimal maintenance. In an industry familiar with two years backlogs for new applications and high end user training cost. This solution provide a tremendous business benefit in terms of return on investment and timelines.

In this section, we are not going into the technical aspects of VB programming; just have a feel of it. Now, you can try out the examples. Now you will see application example by writing code. Of course, you can examine by writing code in to Microsoft Visual Basic Code Window. Which is shown below in figure 1.4.

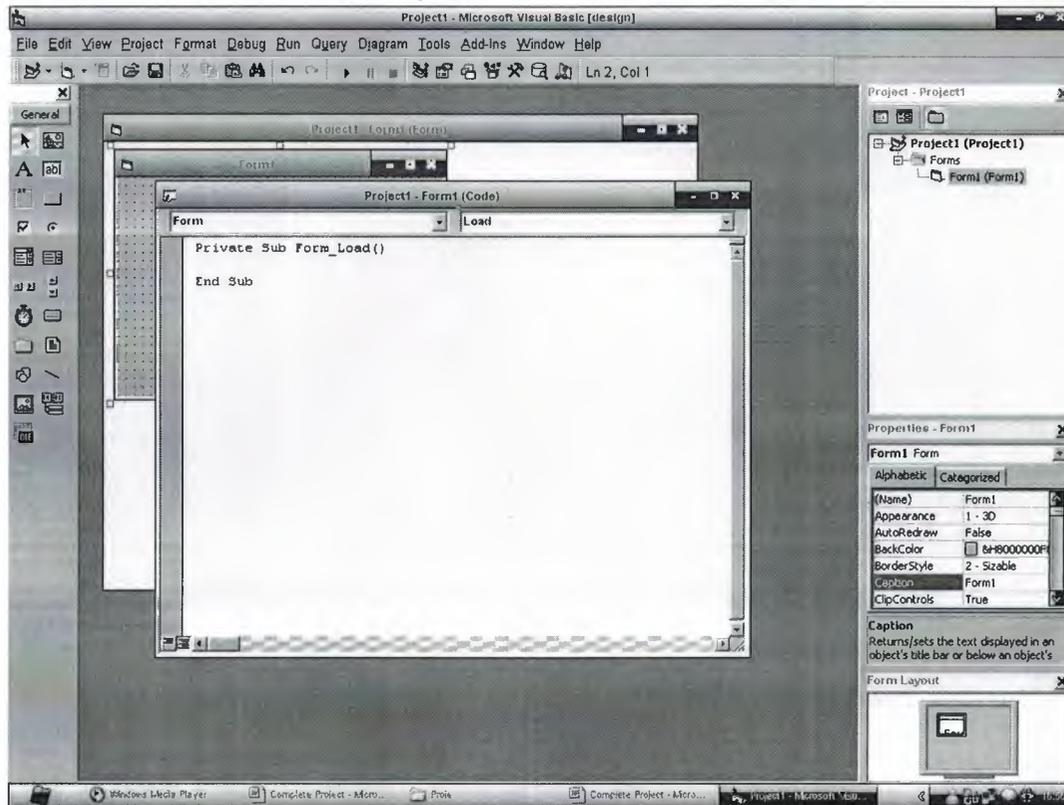

Figure 1.3. Visual Basic Code Window

Now you can drop onto form command button, list box, text box, option....etc and select an object and procedure then can write code whatever you want. You can see example below.

Example 1.1.

```
Private Sub Command1_Click()  
Label1.Caption = "Com 400 Graduation Project Murat ŞEKERCİ 20011036"  
End Sub
```

```
Private Sub Form_Load()  
Command1.Caption = "Display"  
Label1.Caption = "You Can Change This Dialog With This Button..!"
```

```
End Sub
```

```
Private Sub Timer1_Timer()
```

```
Label1.Caption = "You Can Change This Dialog With This Button..!"
```

```
End Sub
```

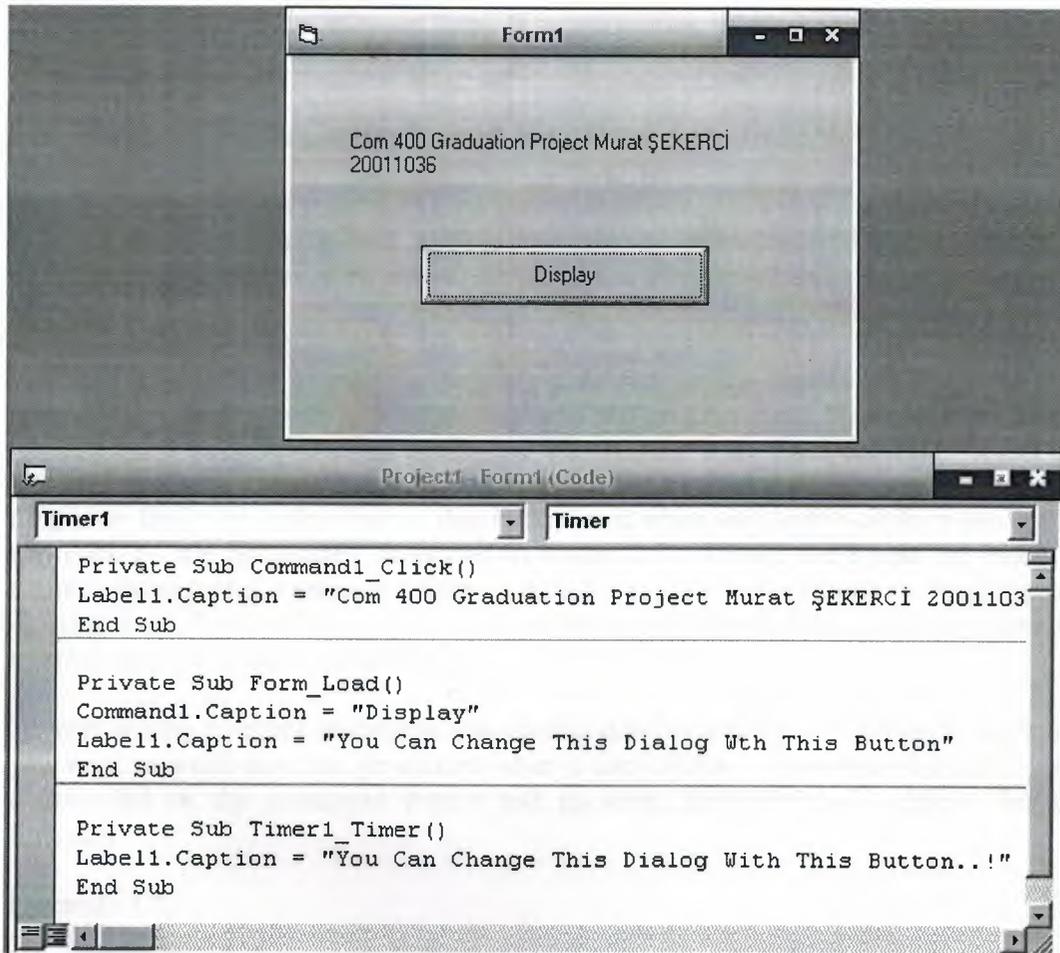

Figure 1.4 : The output of example 1.1.

1.4. Steps in Building a Visual Basic Application

Generally, there are three basic steps in building a VB application. The steps are as follows:

Step 1 : Design the interface

Step 2 : Set Properties of the controls (Objects)

Step 3 : Write the events' procedures

When you will write program. If you can follow that steps which are benefit for you. You can improve your project by using other opportunities. Lets talk about other opportunities. Which are you can design your project witout using code. You can change your objects on to your form from properties window, tools, menu editor, format..etc.

1.5. Working With Controls And Writing Code

Before writing an event procedure for a control to response to a user's input, you have to set certain properties for the control to determine its appearance and how it will work with the event procedure. You can set the properties of the controls in the properties windows.

you have learned how to enter the program code and run the sample VB programs but without much understanding about the logics of VB programming. Now, let's get down learning a few basic rules about writing the VB program code. Each control or object in VB can usually run many kinds of events or procedures; these events are listed in the dropdown list in the code window that is displayed when you double-click on an object and click on the procedures' box(refer to Figure 2.3). Among the events are loading a form, clicking of a command button, pressing a key on the keyboard or dragging an object and etc. For each event, you need to write an event procedure so that an action or a series of actions can be performed.

To start writing an event procedure, you need to double-click an object. For example, if you want to write an event procedure when a user clicks a command button, you double-click on the command button and an event procedure will appear like in figure2.4

Example 1.2.

```
Private Sub Command1_Click()  
    Label1.Caption = "Com 400 Graduation Project Murat Şekerci 20011036"  
End Sub
```

Syntaxes that do not involve setting of properties are also English-like, some of the commands are **Print**, **If...Then....Else....End If**, **For...Next**, **Select Case.....End Select** , **End** and **Exit Sub**. For example, **Print " Visual Basic"** is to display the text Visual Basic on screen and **End** is to end the program. Other commands will be explained in details in the coming lessons.

Program codes that involve calculations is very easy to write, you need to write them almost liket what you do in mathematics. However, in order to write an event procedure that involves calculations, you need to know the basic arithmetic operators in VB as

they are not exactly the same as the normal operators we use, except for + and - . For multiplication, we use *, for division we use /, for raising a number x to the power of n, we use x ^n and for square root, we use Sqr(x). More advanced mathematical functions such as Sin, Cos, Tan , Log and etc. There are also two important functions that are related to arithmetic operations, i.e. the functions Val and Str\$ where Val is to convert text entered into a textbox to numerical value and Str\$ is to display a numerical value in a textbox as a string (text). While the function Str\$ is as important as VB can display a numeric values as string implicitly, failure to use Val will results in wrong calculation. Let's examine Example1.1.

1.6. Managing Data Types

There are many types of data we come across in our daily life. For example, we need to handle data such as names, addresses, money, date, stock quotes, statistics and etc everyday. Similarly in Visual Basic, we are also going to deal with these kinds of data. However, to be more systematic, VB divides data into different types.

1.6.1 Numeric Data

Numeric data are data that consists of numbers, which can be computed mathematically with various standard operators such as add, minus, multiply, divide and so on. In Visual Basic, the numeric data are divided into 7 types, they are summarized in Table1.1

Type	Storage	Range of Values
Byte	1 byte	0 to 255
Integer	2 bytes	-32,768 to 32,767
Long	4 bytes	-2,147,483,648 to 2,147,483,648
Single	4 bytes	-3.402823E+38 to -1.401298E-45 for negative values 1.401298E-45 to 3.402823E+38 for positive values.
Double	8 bytes	-1.79769313486232e+308 to -4.94065645841247E-324 for negative values 4.94065645841247E-324 to 1.79769313486232e+308 for positive values.

Table 1.1: Numeric Data Types

1.6.2 Non-numeric Data Types

The nonnumeric data types are summarized in Table1.2

Data Type	Storage	Range
String(fixed length)	Length of string	1 to 65,400 characters
String(variable length)	Length + 10 bytes	0 to 2 billion characters

Date	8 bytes	January 1, 100 to December 31, 9999
Boolean	2 bytes	True or False

Table 1.2: Nonnumeric Data Types

1.6.3. Declaring Variables

In Visual Basic, one needs to declare the variables before using them by assigning names and data types. They are normally declared in the general section of the codes' windows using the **Dim** statement.

The format is as follows:

Dim variableName as DataType

Example 1.3

```
Dim password As String
Dim yourName As String
Dim firstnum As Integer
Dim secondnum As Integer
Dim total As Integer
Dim doDate As Date
```

You may also combine them in one line, separating each variable with a comma, as follows: Dim password As String, yourName As String, firstnum As Integer,.....

If.....Then.....Else Statements with Operators

To effectively control the VB program flow, we shall use If...Then...Else statement together with the conditional operators and logical operators.

The general format for the if...then...else statement is

If conditions **Then**

VB expressions

Else

VB expressions

End If

Select Case

If you have a lot of conditional statements, using If..Then..Else could be very messy. For multiple conditional statements, it is better to use Select Case. The format is :

Select Case expression

Case value1

Block of one or more VB statements

Case value2
Block of one or more VB Statements
End Select

Looping

Visual Basic allows a procedure to be repeated as many times as long as the processor could support. This is generally called looping .

1. Do

Block of one or more VB statements
Loop While condition

2. Do

Block of one or more VB statements

Loop Until condition

3. For....Next Loop

For counter=startNumber to endNumber (Step increment)

One or more VB statements

Next

1.7. Introduction to VB Functions

1.7.1 Creating Functions

The general format of a function is as follows:

Public Function **functionName** (Arg As dataType,.....) As dataType
or
Private Function **functionName** (Arg As dataType,.....) As dataType

*Public indicates that the function is applicable to the whole program and
Private indicates that the function is only applicable to a certain module or procedure.

Example 1.4

In this example, a user can calculate future value of a certain amount of money he has today based on the interest rate and the number of years from now supposing he will invest this amount of money somewhere). The calculation is based on the compound interest rate.

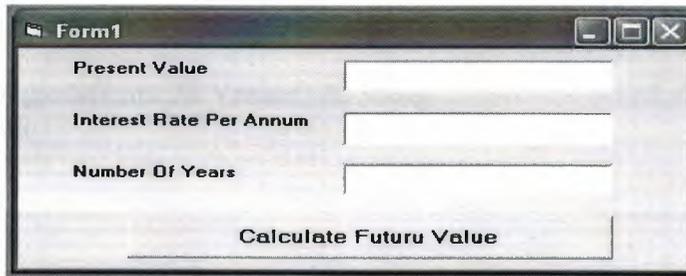

Figure1.5. Example1.4. output

```
Public Function FV(PV As Variant, i As Variant, n As Variant) As Variant
'Formula to calculate Future Value(FV)
'PV denotes Present Value
FV = PV * (1 + i / 100) ^ n
End Function
```

```
Private Sub compute_Click()
'This procedure will calculate Future Value
Dim FutureVal As Variant
Dim PresentVal As Variant
Dim interest As Variant
Dim period As Variant
PresentVal = PV.Text
interest = rate.Text
period = years.Text
FutureVal = FV(PresentVal, interest, period)
MsgBox ("The Future Value is " & FutureVal)
End Sub
```

Example1.5.

The following program will automatically compute examination grades based on the marks that a student obtained.

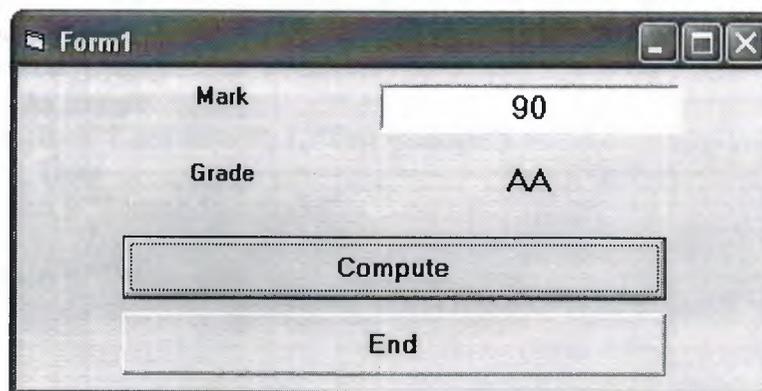

Figure 1.6. Examples 1.5' output

```
Public Function grade(mark As Variant) As String
Select Case mark
Case Is >= 80
grade = "A"
Case Is >= 70
grade = "B"
Case Is >= 60
grade = "C"
Case Is >= 50
grade = "D"
Case Is >= 40
grade = "E"
Case Else
grade = "F"
End Select
End Function
```

```
Private Sub compute_Click()
grading.Caption = grade(mark)
End Sub
```

```
Private Sub End_Click()
End
End Sub
```

I want to remind you something about functions in Visual Basic. Also message boxes are functions inside of Visual Basic. When you write **msgbox()** programs automatically call functions from inside of Visual Basic. I will explain a little with an example. In this explanation, we are going to learn two very basic but useful internal functions, i.e. the **MsgBox()** and **InputBox()** functions.

The objective of **MsgBox** is to produce a pop-up message box and prompt the user to click on a command button before he/she can continue. This message box format is as follows:

Example 1.6.

```
Private Sub Test_Click()
Dim testmsg As Integer
testmsg = MsgBox("Click to test", 1, "Test message")
If testmsg = 1 Then
Display.Caption = "Testing Successful"
Else
Display.Caption = "Testing fail"
End If

End Sub
```

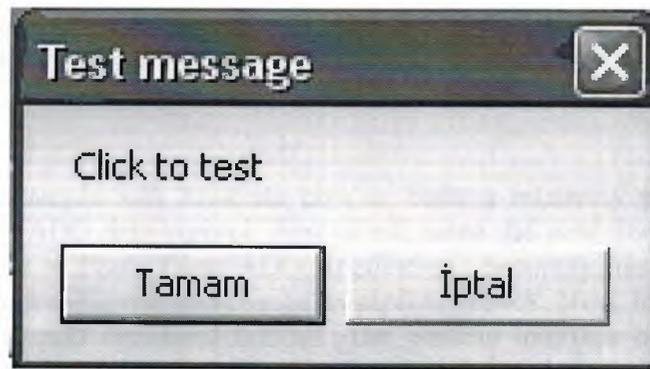

Figure 1.7. Showing MsgBox()

1.8. Declaring Array

We could use Public or Dim statement to declare an array just as the way we declare a single variable. The Public statement declares an array that can be used throughout an application while the Dim statement declare an array that could be used only in a local procedure. The general format to declare an array is as follow:

Dim arrayName(subs) as dataType

where subs indicates the last subscript in the array.

Example 13.1

```
Dim FindName(10) as String
```

1.9. Database Application

Finally, I want to put end point in that part, with telling about database application. Of course, All topics is not restricted what I emphasize in that part.

Visual basic allows us to manage databases created with different database program such as MS Access, Dbase, Paradox and etc. In this lesson, we are not dealing with how to create database files but we will see how we can access database files in the VB environment

1.9.1. Using ADO Control

We have learned to build VB database applications using data control. However, data control is not a very flexible tool as it could work only with limited kinds of data and must work strictly in the Visual Basic environment. To overcome these limitations, we can use a much more powerful data control in VB known as ADO control. ADO stands for ActiveX data objects. As ADO is ActiveX-based, it could work in different platforms (different computer systems) and different programming languages. Besides, it could access many different kinds of data such as data displayed in the Internet browsers, email text and even graphics other than the usual relational and non relational database information.

To be able to use ADO data control, you need to insert it into the toolbox. To do this, simply press Ctrl+T to open the components dialog box and select Microsoft ActiveX Data Control 6. After this, you can proceed to build your ADO-based VB database applications.

The following example will illustrate how to build a relatively powerful database application using ADO data control. First of all, name the new form as Student and change its caption to Book Tiles- ADO Application. Secondly, insert the ADO data control and name it as Course and change its caption to book. Next, insert the necessary labels, text boxes and command buttons. The runtime interface of this program is shown in the diagram below, it allows adding and deletion as well as updating and browsing of data.

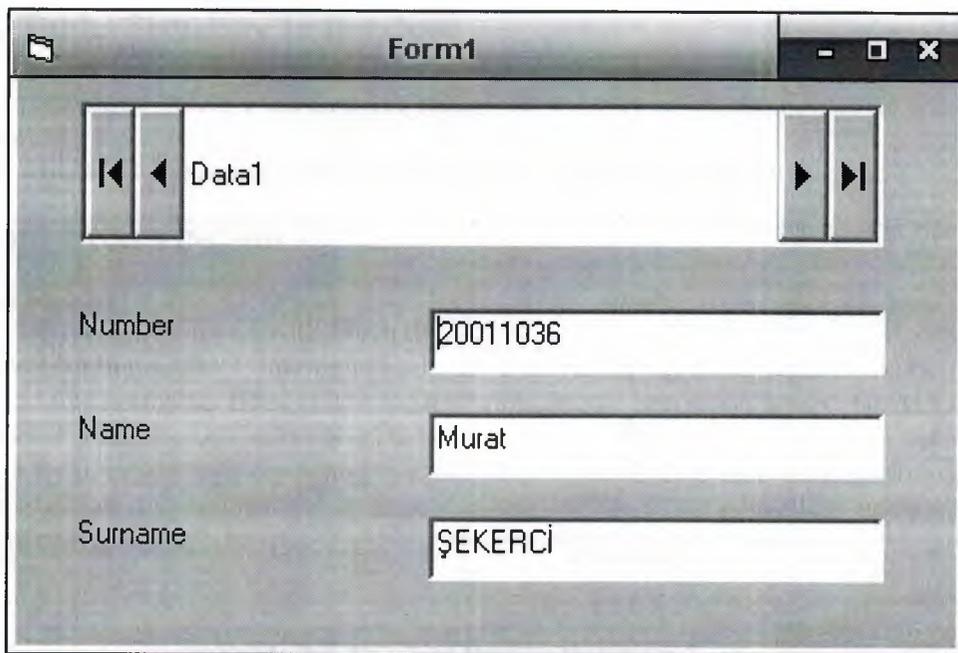

Figure1.8. Using Ado Control

Consequently, As mentioned before. All things are not limeted that, 'what I told in that project'. As you gues. Many things can be done using Visual Basic. You can animate, file manage, advance database managing...etc. I summarized here, whichs was used in that project. I hope that, What I told this part. Which will give opinion to you 'how i did that project'.

CHAPTER TWO: DATABASE STRUCTURE

2.1. Brief Information

General structure of database consists of one database and ten (10) tables. Which are User, Stock, Customer, Category, Producttype, Sales, Content, Loan, Payment, Refusal. I constructed program's database using Microsoft Access Database. Aspecially when I was establishing program's database, i paid my attention do not duplicate in my tables. More duplication means more memory and less speed. Also I studied with SQL(Structured Query Language), DAO and ADO commands. It is much usefull to combine program with database.

2.2. Tables Structure In Database

As I mentioned before I used twelve table with a Access Database. All tables are given below.

User database table includes information about Company Selling Buying and Reports.

PRODUCT BUYING:DB			
Field Name	Type	Size	Key
Product Buying Code	String	8	*
Company Code	String	8	
Date	Date	Short Date	
Total	Monetaryunit	Constant	

Table 2.1. Product Buying Database Table

PRODUCT BUYING CONTENT.DB			
Field Name	Type	Size	Key
Product Buying Code	String	8	*
Content Code	String	2	
Product Code	String	6	
Color	String	15	
Piece	Number	Longinteger	
Total Price	Monetaryunit	Constant	

Table 2.2. Product Buying Content Database Table

SELLING.DB			
Field Name	Type	Size	Key
Selling Code	String	8	*
Selling Date	Date	Date	
Customer Code	String	8	
Reduction	Yes/No	Yes/No	
Total Reduction	Monetaryunit	Constant

2.3. Relation Between Tables

All tables was created in Microsoft Access Database. All relations was done from relation menu. There are ten (10) tables. As you know, that tables includes many key to make relation easyly. Which keys are primary key, foreing key, komposit key. Some times,to do primary key from one column is not possible.that's why composite key can be selected. All keys are used to make relation between tables. Relations are between that keys. To see relation is little hard, but understand is very easy. Of course you can also see clearly in the figure below.

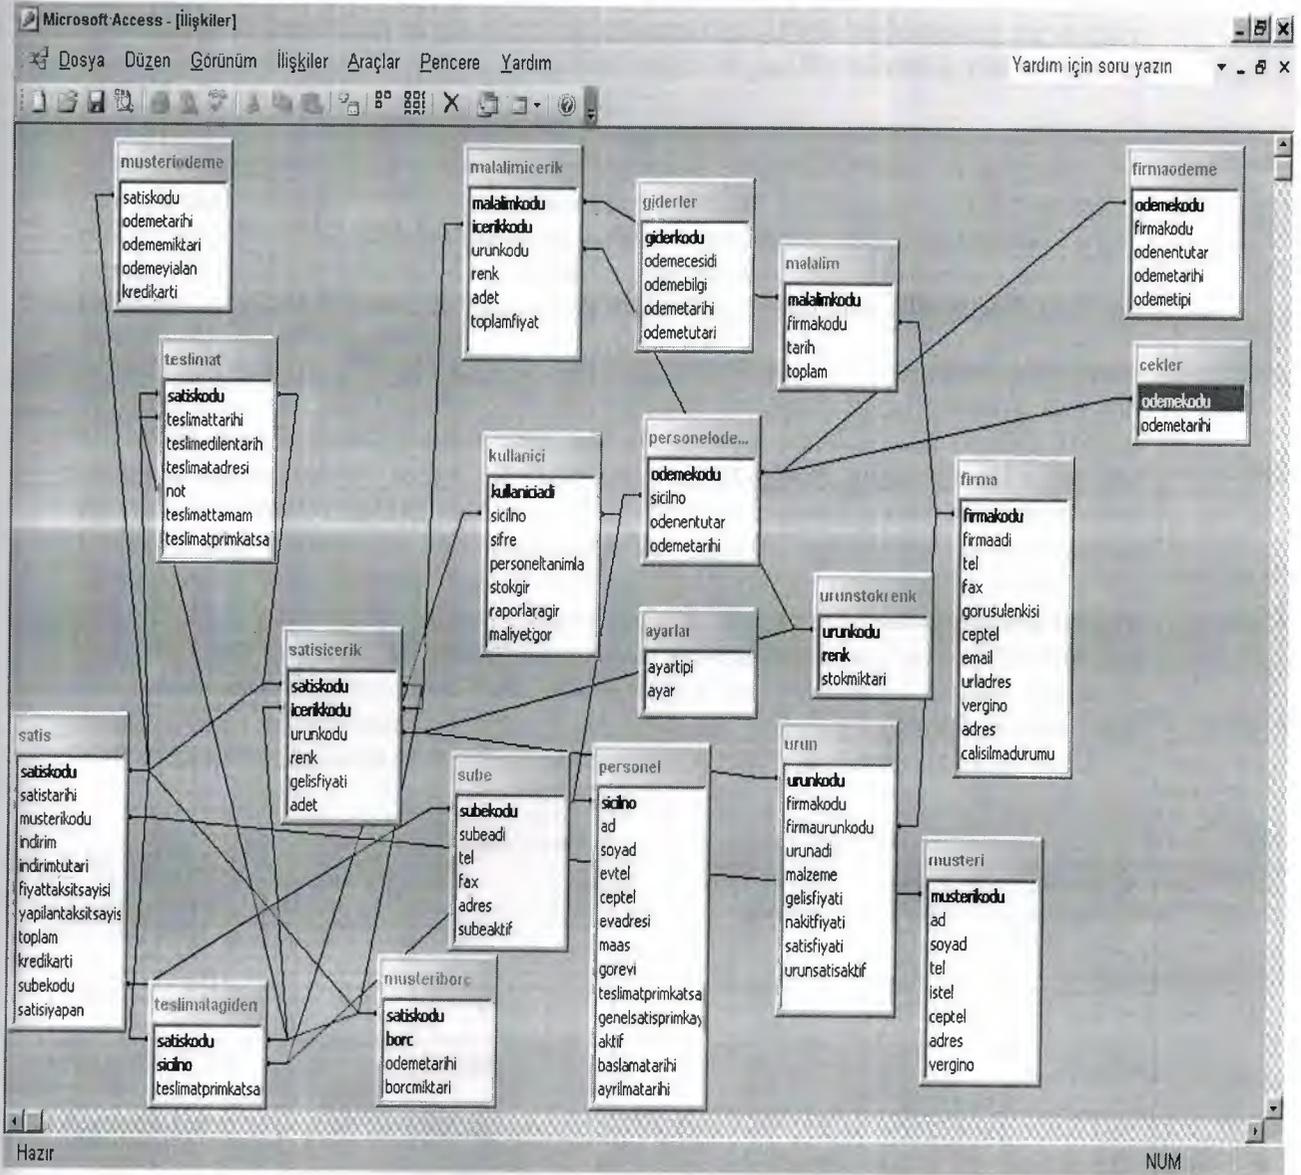

Figure 2.1. Relation Between Tables

As you saw above, all tables was done with using Microsoft Access Database. I will give brief information about Access and SQL(Structured Query Language). Of course, Using SQL in Access Database is possible. Also you will find more information about SQL.

2.4. Microsoft Access Database

2.4.1. Microsoft Access Database Fundamentals

Are you overwhelmed by the large quantities of data that need to be tracked in your organization? Perhaps you're currently using a paper filing system, text documents or a spreadsheet to keep track of your critical information. If you're searching for a more flexible data management system, a database might be just the salvation you're looking for.

What is a database? Quite simply, it's an organized collection of data. A database management system (DBMS) such as Access, FileMaker Pro, Oracle or SQL Server provides you with the software tools you need to organize that data in a flexible manner. It includes facilities to add, modify or delete data from the database, ask questions (or queries) about the data stored in the database and produce reports summarizing selected contents.

Microsoft Access provides users with one of the simplest and most flexible DBMS solutions on the market today. Regular users of Microsoft products will enjoy the familiar Windows "look and feel" as well as the tight integration with other Microsoft Office family products. An abundance of wizards lessen the complexity of administrative tasks and the ever-present Microsoft Office Helper (you know... the paper clip!) is available for those who care to use it. Before purchasing Access, be sure that your system meets Microsoft's minimum system requirements. To further our discussion, let's first examine three of the major components of Access that most database users will encounter – tables, queries, forms. Once we've completed that we'll look at the added benefits of reports, web integration and SQL Server integration.

EXPENCES.DB			
Field Name	Type	Size	Key
Expences Code	String	10	*
Payment Type	String	1	
Payment Info	String	30	
Payment Date	Date	Date	
Total Payment	Monetaryunit	Constant	

Figure 2.2 Sample Table

The table above contains the employee information for our organization characteristics like name, date of birth and title. Examine the construction of the table and you'll find that each column of the table corresponds to a specific employee characteristic (or **attribute** in database terms). Each row corresponds to one particular employee and contains his or her information. That's all there is to it! If it helps, think of each one of these tables as a spreadsheet-style listing of information.

In the previous section, we learned how tables allow us to create the framework for storing information in a database. Obviously, a database that only stored information would be useless -- we need methods to retrieve information as well. If you simply want to recall the information stored in a table, Microsoft Access allows you to open the table and scroll through the records contained within it. However, the real power of a database lies in its capabilities to answer more complex requests, or **queries**. Access queries provide the capability to combine data from multiple tables and place specific conditions on the data retrieved.

2.4.2. Creating Table

Many techniques allow you to create a database, the fastest of which consists of using one of the provided examples. Microsoft Access 97 shipped with 22 sample databases while Microsoft Access 2000 ships with 10. Furthermore, the 97 version allowed to provide sample data into the database. This is not available with the 2000 release. The databases that ship with Microsoft Access can help you in two main ways: they provide a fast means of creating a database and you can learn from their structure.

To create a database using one of the samples, there is a little detail to follow depending on whether you had launched the program already or not. If Microsoft Access is not running, you can start it. When the first dialog box comes up, you can click the second radio button: Access Database Wizard, Pages

The New dialog box displays two property pages labeled General and Databases. If you want to create a database based on one of the samples, you can click the Databases property page. A list of the sample databases appears. You can then choose one and click OK.

When creating a database using one of the samples, depending on the sample you selected, the Database Wizard will display a few objects and suggest some fields for your database. Some fields are already associated with the objects and some other fields can be added. You can examine them, then add some fields you think are important for your database. You will also have the option of selecting a design layout. Some of the sample databases have been configured to require information about the company you are creating the database for.

2.5. Introducing Database

Databases are designed to offer an organized mechanism for storing, managing and retrieving information. They do so through the use of tables. If you're familiar with spreadsheets like Microsoft Excel, you're probably already accustomed to storing data in tabular form. It's not much of a stretch to make the leap from spreadsheets to databases.

Just like Excel tables, database tables consist of columns and rows. Each column contains a different type of attribute and each row corresponds to a single record. For example, imagine that we were building a database table that contained names and telephone numbers. We'd probably set up columns named "FirstName", "LastName" and "TelephoneNumber." Then we'd simply start adding rows underneath those columns that contained the data we're planning to store.

At this point, you're probably asking yourself an obvious question – if a database is so much like a spreadsheet, why can't I just use a spreadsheet? Databases are actually much more powerful than spreadsheets in the way you're able to manipulate data. Here are just a few of the actions that you can perform on a database that would be difficult if not impossible to perform on a spreadsheet:

- Retrieve all records that match certain criteria
- Update records in bulk
- Cross-reference records in different tables
- Perform complex aggregate calculations

As we walk through this tutorial, you'll learn how you can use databases to achieve each of these objectives. Page 2 of this lesson provides you with an overview of how database keys can be used to uniquely identify records and form relationships between tables. Page 3 describes how the Structured Query Language allows you to interact with your database. On page 4, we examine the different types of databases available on the market today.

2.6. Database Keys

On the previous page of this article, you learned how databases use tables to organize data. As you probably recall, each table consists of a number of rows, each of which corresponds to a single database record. So, how do databases keep all of these records straight? It's through the use of **keys**.

The first type of key we'll discuss is the **primary key**. Every database table should have one or more columns designated as the primary key. The value this key holds should be unique for each record in the database. For example, assume we have a table called Employees that contains personnel information for every employee in our firm. We'd need to select an appropriate primary key that would uniquely identify each employee. Your first thought might be to use the employee's name.

This wouldn't work out very well because it's conceivable that you'd hire two employees with the same name. A better choice might be to use a unique employee ID number that you assign to each employee when they're hired. Some organizations choose to use Social Security Numbers (or similar government identifiers) for this task because each employee already has one and they're guaranteed to be unique. However, the use of Social Security Numbers for this purpose is highly controversial due to privacy concerns.

Once you decide upon a primary key and inform the database of this decision, it will

enforce the uniqueness of the key. If you try to insert a record into a table with a primary key that duplicates an existing record, the insert will fail.

Most databases are also capable of generating their own primary keys. Microsoft Access, for example, may be configured to use the AutoNumber data type to assign a unique ID to each record in the table. While effective, this is a bad design practice because it leaves you with a meaningless value in each record in the table. Why not use that space to store something useful?

The other type of key that we'll discuss in this course is the **foreign key**. These keys are used to create relationships between tables. Natural relationships exist between tables in most database structures. Returning to our employees database, let's imagine that we wanted to add a table containing departmental information to the database. This new table might be called Departments and would contain a large amount of information about the department as a whole. We'd also want to include information about the employees in the department, but it would be redundant to have the same information in two tables (Employees and Departments). Instead, we can create a **relationship** between the two tables.

Let's assume that the Departments table uses the Department Name column as the primary key. To create a relationship between the two tables, we add a new column to the Employees table called Department. We then fill in the name of the department to which each employee belongs. We also inform the database that the Department column in the Employees table is a **foreign key** that references the Departments table. The database will then enforce *referential integrity* by ensuring that all of the values in the Departments column of the Employees table have corresponding entries in the Department table.

Note that there is no uniqueness constraint for a foreign key. We may (and most likely do!) have more than one employee belonging to a single department. Similarly, there's no requirement that an entry in the Departments table have *any* corresponding entry in the Employees table. It is possible that we'd have a department with no employees.

2.7. Working with SQL

SQL (pronounced "ess-que-el") stands for structured Query Language. SQL is used to communicate with a database. According to ANSI (American National Standards Institute), it is the standard language for relational database management systems. SQL statements are used to perform tasks such as update data on a database, or retrieve data from a database. Some common relational database management systems that use SQL are: Oracle, Sybase, Microsoft SQL Server, Access, Ingress, etc. although most database systems use SQL, most of them also have their own additional proprietary extensions that are usually only used on their system. However, the standard SQL commands such as "select", "insert", "delete", "create" and "drop" can be used to accomplish almost everything that one needs to do with a database.

2.7.1. Data Manipulation Language

The Data Manipulation Language (DML) is used to retrieve, insert and modify database information. These commands will be used by all database users during the routine operation of the database. Let's take a brief look at the basic DML commands:

The Data Manipulation Language (DML) is used to retrieve, insert and modify database information. These commands will be used by all database users during the routine operation of the database. Let's take a brief look at the basic DML commands:

2.7.1.1.INSERT

The INSERT command in SQL is used to add records to an existing table. Returning to the personal_info example from the previous section, let's imagine that our HR department needs to add a new employee to their database. They could use a command similar to the one shown below:

```
INSERT INTO Stock
values('1','Titanic', 'DVD', 'Romance',5)
```

Note that there are four values specified for the record.

These correspond to the table attributes in the order they were defined: first_name, last_name, employee_id, and salary.

2.7.1.2.SELECT

The SELECT command is the most commonly used command in SQL. It allows database users to retrieve the specific information they desire from an operational database. Let's take a look at a few examples, again using the personal_info table from our employees database.

The command shown below retrieves all of the information contained within the personal_info table. Note that the asterisk is used as a wildcard in SQL. This literally means "Select everything from the personal_info table."

```
SELECT *
FROM customer;
```

Alternatively, users may want to limit the attributes that are retrieved from the database. For example, the Human Resources department may require a list of the last names of all employees in the company. The following SQL command would retrieve only that information:

```
SELECT name,surname
FROM customer WHERE cuscode='3';
```

4.1. User Entrence

Figure 4.1. User Entrence

In this menu we enter User Name and Password, the username field is in combo type, we can select existing user, if we write a wrong password the program alert us and gives a message. After we press on Ok the programs enter to Main Menu.

4.2. Main Page

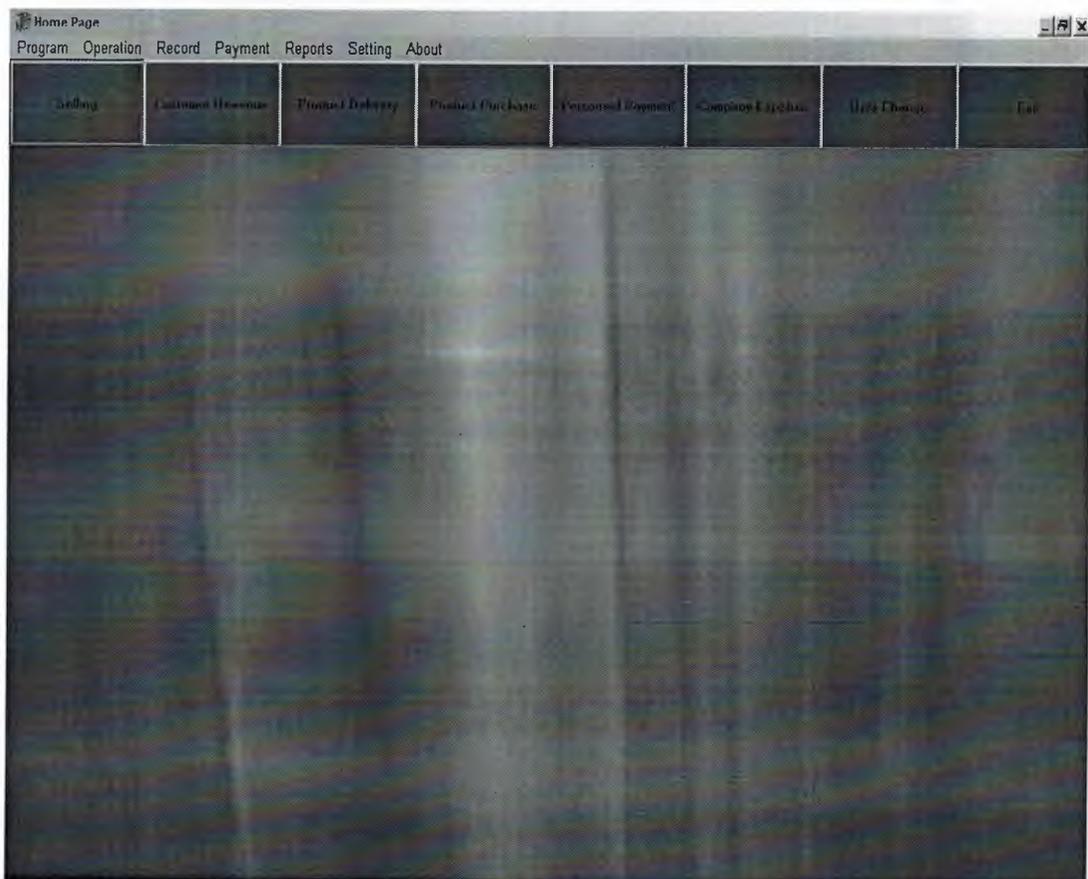

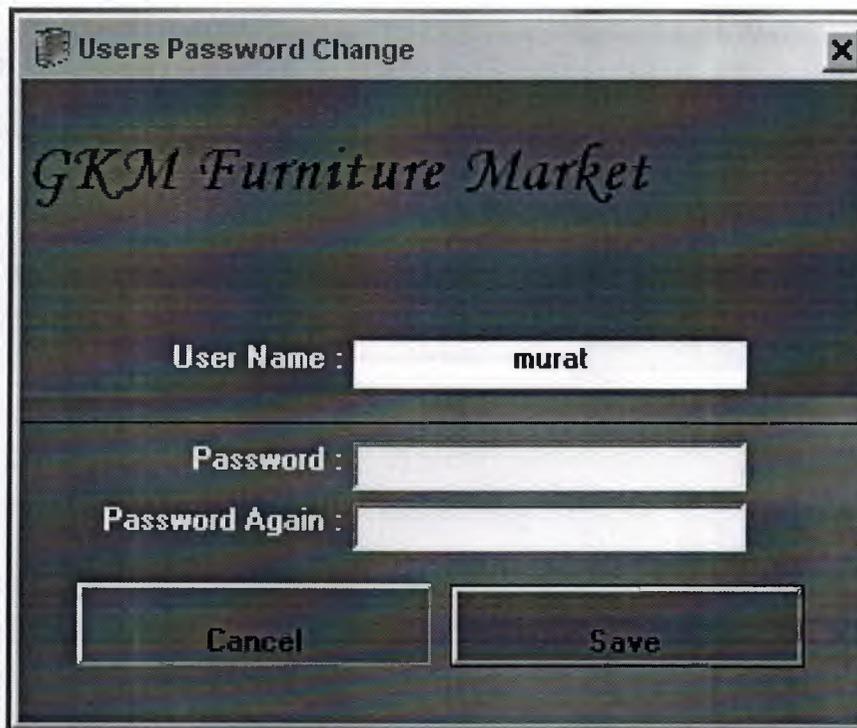

Figure 4.2. Main Page

This is the Main Page of our program, through this page we do all the operations necessary.

This page has menu and it's sub menu : Program (Change Users Password , Change Users , Exit) , Operation (Selling , Customer Revenue And Delivering Info , Product Delivery , Product Buying , Last Selling Info And Cancel The Selling , Change List Of Product Price By Company , Print Sticker , Print List Of Price) , Record (Customer Registration , Company Registration , Enter Company Reduction Proportion , Product Registration , Personel Registration , Branch Registration) , Payment (Exgense Of Company , Personel Payment , Company Payment) , Reports (Delayed Payment , Selling And Profit Reports , Payment Reports , Personel Expense Reports , ompany Expense Reports , Product Buying And Dept Reports , Cheque Reports , Stoch Report) Setting (Set Profit Proportion , Set Personel Premium Proportion , Set Print Copy , Personel Premium Salary Calculate) , About (Program About)

4.2.1.1 Users Password Change

The screenshot shows a dialog box titled "Users Password Change" with a close button in the top right corner. The background is dark with the text "GKM Furniture Market" in a large, stylized font. Below the title, there are three input fields: "User Name" with the value "murat", "Password", and "Password Again". At the bottom, there are two buttons: "Cancel" and "Save".

Figure 4.2.1.1 Users Password Change

In This page we can change password of the user who entered to the program, we can't change other users password. Same times we need the change our password when we want to change our password we should enter the our old password then enter our new password 2 times then click the save button and we can use our new password.

4.2.1.2 Change Users

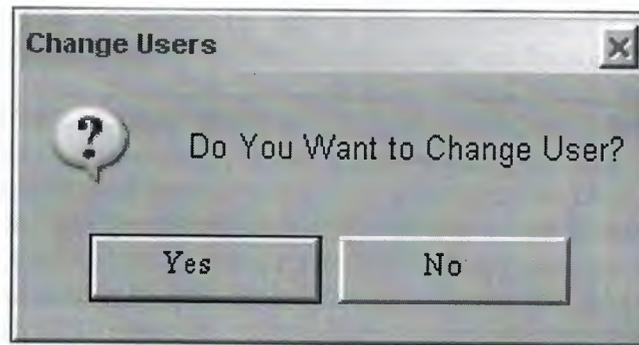

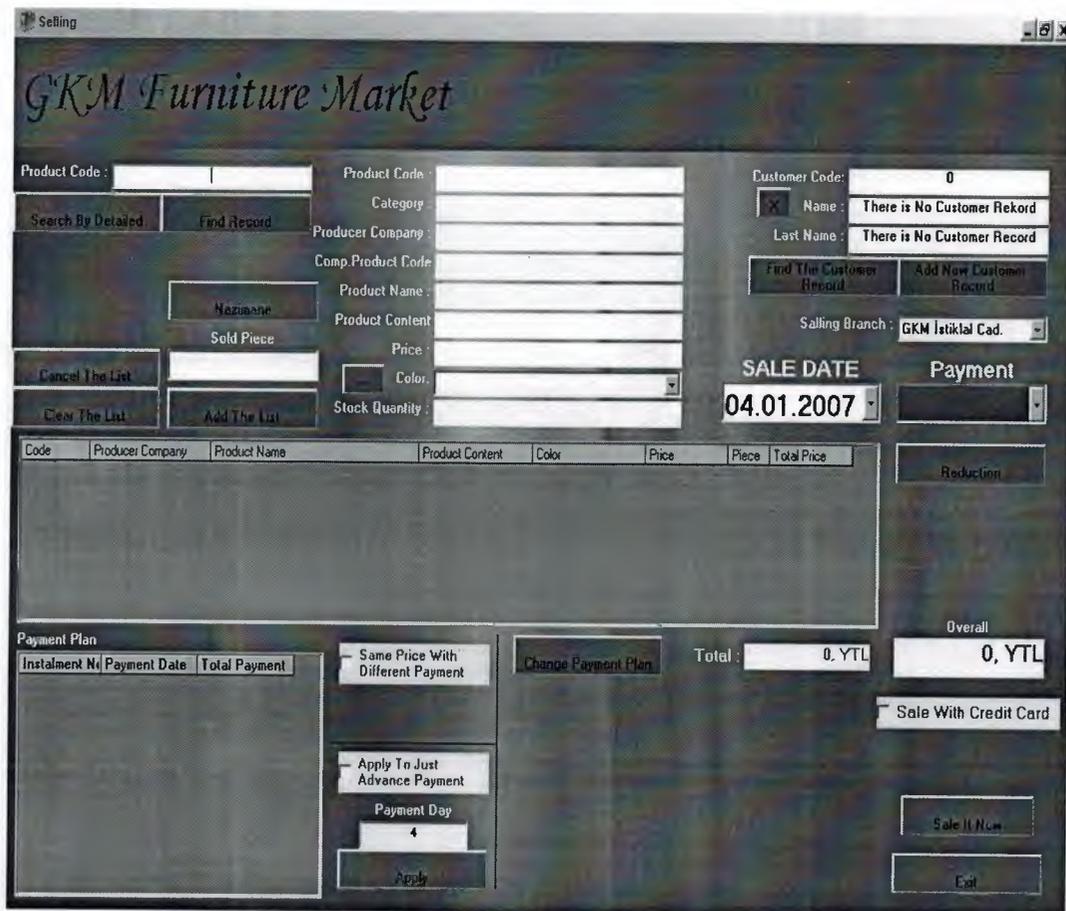

Figure 4.2.1.2 Change Users

In this form we can change active users.

4.2.2.1 Selling

The screenshot shows a complex software interface for 'Selling' at 'GKM Furniture Market'. The interface is divided into several sections:

- Product Search:** Includes fields for 'Product Code', 'Category', 'Producer Company', 'Comp. Product Code', 'Product Name', 'Product Content', 'Price', 'Color', and 'Stock Quantity'. There are buttons for 'Search By Detailed', 'Find Record', 'Cancel The List', 'Clear The List', and 'Add The List'.
- Customer Information:** Includes 'Customer Code' (set to 0), 'Name' (with a message 'There is No Customer Record'), and 'Last Name' (with a message 'There is No Customer Record'). Buttons for 'Find The Customer Record' and 'Add New Customer Record' are present.
- Sale Details:** Includes 'Selling Branch' (GKM Istiklal Cad.), 'SALE DATE' (04.01.2007), and 'Payment' options.
- Product Table:** A table with columns: Code, Producer Company, Product Name, Product Content, Color, Price, Piece, Total Price. The table is currently empty.
- Payment Plan:** Includes a table for 'Payment Plan' with columns 'Instalment No', 'Payment Date', and 'Total Payment'. It also has buttons for 'Same Price With Different Payment', 'Change Payment Plan', 'Apply To Just Advance Payment', and 'Payment Day' (set to 4).
- Summary and Actions:** Includes 'Overall' (0, YTL), 'Total' (0, YTL), 'Sale With Credit Card', 'Sale It Now', and 'Exit' buttons.

Figure 4.2.2.1 Selling

In this form we can selling the production. when we want to selling same production we will search with production code then we will sell it or other ways if we dont know the

production code or we want to search more details then we will use "Search By Details" button. when we click this button more details are open on selling form then we can enter more details and find production for selling. When we selling the production we will select the production and add to list then search another production and again add to list ofcourse we can cancel the production from list or cancel the all production from list with "clear list" button. when finish all production selected, then we will find the customer who buy that production, if this customer record is exist in our database we will use "find the customer record" button then goto customer search page and find the customer and come back the selling page or if customer is new or there is no any record in database about that customer, then we will use "add new customer" button then goto customer registration page and fill all info about customer and save it then come back the selling page. when all operation is complete about production and customer we will select the date. if we dont change payment, there are 9 instalment with cash price. If we want to change this instalment we can choice 1+1 to 36+1 instalment ofcourse when instalment is increase price is increase. when we click the "Reduction" button 2 reduction choosing will be open on selling page. "Monetary Reduction" or "Percentage Reduction" we will choice same of them. if we select the instalment ofcourse there is payment plan and it is showing on page. And if we want to change change payment plan we will use "Change Payment Plan" and then last operation is sale the productions.

4.2.2.2 Customer Payment and Instalment

The screenshot displays the 'Customer Payment to Instalment' application window. At the top, it features the 'GKM Furniture Market' logo. Below the logo, there are several input fields for customer details: Customer Code, Name, Last Name, Tax No, Home Phone, Work Phone, Mobile Phone, and Address. A 'Find the Customer Record' button is positioned to the right of these fields. Below the input fields is a table with columns: Selling Cor, Selling Date, Payment Plan, Reduction, Total Selling, Payment, SBranch, and Selling Personnel. To the right of this table are buttons for 'Sales Info' and 'Sending Info'. The main section is titled 'To Make Payment' and contains a table with columns: Payment Date, Take Payment by Personne, Total Payment, and Payment Typ. To the right of this table is a 'Cheque No' input field and a 'Print' button. Below these are buttons for 'Add Payment' and 'Payment Plan'. A 'Dept Info' table with columns: Payment Plan, Payment Date, Total Dept, and Payment Case is also present. At the bottom of the interface, there are summary statistics: 'Total All Payment : 0, YTL', 'Total Dept : 0, YTL', 'Dept For Today : 0, YTL', and 'Net Dept : 0, YTL'.

Figure 4.2.2.2 Customer Payment and Instalment

In this page we can see customer payment and instalment. we can search and find the customer then customer payment, customer instalment and customer dept info will be showing. If customer make payment then we will save the payment and calculate the new dept of the customer. This page include the info about selling dept and payment. If we want to print that page click the "print page" button.

4.2.2.3 Delivery Info

The screenshot shows a software application window titled "Deliver Info" for "GKM Furniture Market". The interface includes a search section with the following elements:

- Radio buttons for "Known Date", "Donot Known Date", and "Donot By Date".
- "Date" field: 04.01.2007
- "Between" field: 04.01.2007
- Checkbox: Didnt Delivered
- Button: Show

Below the search section is a table with the following headers:

Selling Code	Delivered Date	Deliver Laze	Date	Submit Adress
--------------	----------------	--------------	------	---------------

At the bottom right of the window, there are two buttons: "Delivered Info" and "Exit".

Figure 4.2.2.3 Delivery Info

In this form include info about delivery. when we sell the furniture we should delivery the customer address so this page showing the delivered or not. we can select the date and click the "show" button then we can see all info about delivery or add the new product will delivery.

4.2.6.5 About

Figure 4.2.6.5 About

CONCLUSION

GKM Furniture market Program is a useful program for Furniture Markets. By using this program they can record and control everything happen in the market and company , for instance, selling furniture , buying furniture ...etc.

The program is easy in use, and everything is in detail, I used Visual Basic Programming Language in building it, also Access Database for storing information's. The program records sale operation. Gkm furnitere program has Furniture detail .customer detail, product detal , company detail repors buying and selling detail dept detail payment and expences details.

For every operation we have special form, for instance when we make a sale to a customer , we open sale page. When we buy new furniture for market, we have special page. For adding item's to stock we have special pages too. every operation has speciall pages.

I used many forms in this project, the main form is sale , the program records everything, we can query all the information's at any time, also when he made that sale and paid part of the money either in cash or by credit card or bank account, the program store paid amount and the remaining loan amount to his/her or company account.

Using this program enables the control of stock, control's. In the same time users can't trick the manager, because whatever they do is recording by the program, users can't enter everywhere of the program, they are restricted by some pages, only the manager can enter wherever he wants.
