ACKNOWLEDGMENTS

“First, I would like to thank my supervisor Mr. Okan DONANGİL for his invaluable advice and belief in my work and myself over the course of this Graduation Project.

Second, I would like to express my gratitude to Near East University for the scholarship that made the work possible.

Third, I thank my family for their constant encouragement and support during the preparation of this project.

Finally, I would also like to thank all my friends for their advice and support.”

ABSTRACT

As the information age has affected every aspect of our life, the need for computerizing many information systems has raised.

Once of the important branches that are affected by information revolution is the computer programming languages.

This project is concerned about using computer program in stock control management system. It is written using Visual Basic 6.0 programming language and used Microsoft Access Database language for databases. Visual Basic is one of the best and easy programming languages.

Before coming to this point, this project has gone through some important steps:

- First one that I had to have some knowledge about how to works this programs.
- Second step was to design and to put in order information about the program.
- The later steps were steps of the implementation of the designed information on computer by using Visual Basic Language.

INTRODUCTION

Like other countries around the globe the public charitable association in our country is unable to satisfy the public need regarding natural disaster as well.

The first 72 hours after the disaster are the most important for saving life.

Most of lives saved within the first 24 hours after the disaster is usually done by neighborhoods uneducated or relative and not by specialist and professional staff.

Because of the interference of uneducated people the number of victims increase and this is arduous in the last the disaster the lift.

I am one of these who personally lives one of these natural disaster happen in 17 august 1999 in Gölçük and decrease touched the lack of such needs.

Mahalle Afet Gönüllüleri is a project done intervening people living there to now what happen in the first 72 hours.

The aim of the project is to provide education equipment and organizing. A special after the first critical hours of the disaster in corporations professional staff.

50 educated well equipped and organized people will be ready to interfere during the first critical hours of the disaster.

In 17 august 1999 the center of the in Kocaeli has started working with the project.

Then started in Yalova and newly in İstanbul.

1 HISTORY OF VISUAL BASIC

1.1 VB was introduced in 1991 as Version 1.0

Very simple controls (controls nuts and bolts of your project, we use controls to get user input and to display output)

Text box controls

List box controls

Combo box controls and a few

No DBMS features

Only sequential and random files

1.2 VB Version 2.0

Increased controls

Feature of DBMS

Paradox (only level of module)

1.3 VB Version 3.0

More powerful DBMS features

No need standard module of DBMS

Data controls are used

OLE 1.0(Object linking and embedding) featur

1.4 VB Version 4.0

Ability to generate 32-bit applications for both windows95 & Windows NT

Use OLE technology of Microsoft

Use some of the techniques of OOP and class modules are introduced

The ability to extend the VB programming environment. Create or use third party tools into the VB environment

Conditional compilation to allow you to do multi platform development more easily

1.5 VB Version 5.0

Compilation of native code, p-code

Create it's own Active-X controls

Multiple projects

Design and application for Internet and Intranet environment with Active-X document

New function of code editor

Downloadable Internet controls

Visual Models

Object base data storage- repository

Has dynamic Linked Library (DDL), to combine VB with another programming languages such as C

You could also create your own OLE controls in C and use them in VB

1.6 VB Version 6.0

Native Code Compiler

Create applications, and both client and server-side components that are optimized for throughput by the world-class Visual C++ 6.0 optimized native-code compiler

ADO (ActiveX Data Objects)

Visual Basic 6.0 introduces ADO as the powerful new standard for data access, Included OLE DB drivers include SQL server 6.5+, Oracle 7.3.3+, Microsoft Access, ODBC, and SNA server

Integrated Professional Visual Database Tools

Visual Basic 6.0 provides a complete set of tools for integrating databases with any application.

Automatic data binding
Data environment designer
Data Report designer
Visual Basic Web Class Designer
Dynamic HTML Page Designer

1.7 Visual Basic Descriptions

Today's most popular operating system for PC's is Windows 98, and also it's an environment that most of the software in the world needs an environment of Windows 98 in order to operate or run. Nearly it became an international standard to make the programs, software to be able to run on Windows 98. So from these points we did a software package that should run on Windows 98. In order to make the programs to run in Windows 98 needs an interface program, which is MS Visual Basic 6.0, which is the most popular Visual Programming language in world for making programs for Windows 98 environment.

Visual Basic is Windows development language, that's why you must be familiar with the Windows environment. The "Visual" part of the "Visual Basic" refers to the method used to create the graphical user interface (GUI). Rather than writing numerous lines of code to describe the appearance and location of interface elements, you simply drag and drop rebuilt objects into place on screen. If you've ever used a drawing program such as Paint, you already have most of the skills necessary to create an effective user interface.

The "Basic" part refers to the BASIC (Beginners Ail-Purpose Symbolic Instruction Code) language, a language used by more programmers than any other language in the history of computing. Visual Basic has evolved from the original BASIC language and now contains several hundred statements, functions, and keywords, many of which relate directly to the Windows GUI. Beginners can create useful applications by learning just a few of the keywords, yet the power of the language allows professionals to accomplish anything that can be accomplished using any other Windows programming language.

Windows involves three key concepts as below;

Window

Events

Messages

1.7.1 Window:

A window is a simply rectangular region with its own boundaries. Examples of windows are:

An Explorer window in windows 95

A document window in word processor

Dialog box that pop up window and reminds you of an appointment

A command button

Icons

Text boxes

Option boxes

Menu bars

Microsoft Windows Operating system manages all of these many windows by assigning each one unique id number. The system continually monitors each of these windows for signs of activity or events.

1.7.2 Events and messages:

An event is an action recognized by a form or control. Events can occur through user action (response) such as a mouse click or a key press using objects of window (through programmatic control), or even as a result of another windows action.

Event-Driven applications execute Basic code in response to an event. Each form and control in VB has a predefined set of events. If one of these events occurs and there is a

user code in the associated event procedure, VB invokes that code. For example most object recognize a Click event. If user clicks a form (object), code in the form's Click event procedure is executed. Each time an event occurs, it causes a message to be sent to the operating system. The system processes the message and broadcast it to the other windows. Each window can take the appropriate action based on its own instructions from dealing with that particular message.

Fortunately, Visual Basic insulates you from having to deal with all of the low-level message handling. Many of the messages are handled automatically by VB. This allows you to quickly create powerful application without having to deal with necessary details.

Programs in conventional programming languages run from the top down. For older programming languages, execution starts from the first line and moves with the flow of the program to different parts as needed.

Visual Basic program usually works completely different. The code doesn't follow a predefined path. It executes different code section in response to events. The core of a Visual Basic programs is a set of independent pieces of code that are activated by, and so respond to, only the event they have been told to recognize.

The programming code in VB that tells your program how to respond to events (event procedure) .An event procedure is a body of code that is only executed in response to an external event.

Your code can also trigger events during execution. It is for this reason that is important to understand the event-driven model and keep it mind when designing VB applications.

The fastest and easiest way to create applications for Microsoft Windows Whether you are an experienced professional or brand new to Windows programming, Visual Basic provides you with a complete set of tools to simplify rapid application development.

The Visual Basic programming language is not unique to Visual Basic. The Visual Basic programming system .Applications Edition included in Microsoft Excel, Microsoft Access, and many other Windows applications uses the same language. Whether your goal is to create a small utility for yourself or your work group, a large enterprise-wide system, or even distributed applications spanning the globe via the Internet, Visual Basic has the tools you need.

Data access features allow you to create databases and front-end applications for most popular database formats, including Microsoft SQL Server and other enterprise-level databases.

ActiveX technologies allow you to use the functionality provided by other applications, such as Microsoft Word, which is a word processor, Microsoft Excel spreadsheet, and other Windows applications. You can even automate applications and objects created using the Professional or Enterprise editions of Visual Basic.

Internet capabilities make it easy to provide access to documents and applications across the Internet from within your application.

Your finished application is a true .exe file that uses a run-time dynamic-link library (DLL) that you can freely distribute.

1.7.3 System Requirements for Visual Basic:

Following hardware and software is required for Visual Basic applications:

Microsoft Windows NT 3.51 or later, or Microsoft Windows 95 or later.

80486 or higher microprocessor.

VGA or higher-resolution screen supported by Microsoft Windows.

8 MB of RAM for applications. (This will vary, depending on the specific type libraries or DLLs you include with your applications.)

16 MB of RAM for the Visual Basic development environment.

1.7.4 Project limitations:

A single project can contain up to 32,000 identifiers, which include, but are not limited to, forms, controls, modules, variables, constants, procedures, functions, and objects. Variable names in Visual Basic can be no longer than 255 characters, and the names of forms, controls, modules, and classes cannot be longer than 40 characters. Visual Basic imposes no limit on the actual number of distinct objects in a project.

1.7.5 Form Structure:

While many of the files in a typical Visual Basic project are in a binary format and are readable only by specific processes and functions of Visual Basic or your application, the form (.Frm) and project (.vbp) files are saved as ASCII text. These are readable in a text viewer (Notepad for instance).

Visual Basic form (.frm) files are created and saved in ASCII format. The structure of a form consists of:

The version number of the file format.

A block of text containing the form description.

A set of form attributes.

The Basic code for the form.

The form description contains the property settings of the form. Blocks of text that define the properties of controls on the form are nested within the form. Controls contained within other controls have their properties nested within the text of the container.

1.8 What we can do with Visual Basic.

1.8.1 Creating User Interface:

The user interface is perhaps the most important part of an application; it's certainly the most visible. To users, the interface is the application; they probably aren't aware of the code that is executing behind the scenes. No matter how much time and effort you put into writing and optimizing your code, the usability of your application depends on the interface.

When you design an application, a number of decisions need to be made regarding the interface. Should you use the single-document or multiple-document style? How many different forms will you need? What commands will your menus include, and will you use toolbars to duplicate menu functions? What about dialog boxes to interact with the user? How much assistance do you need to provide?

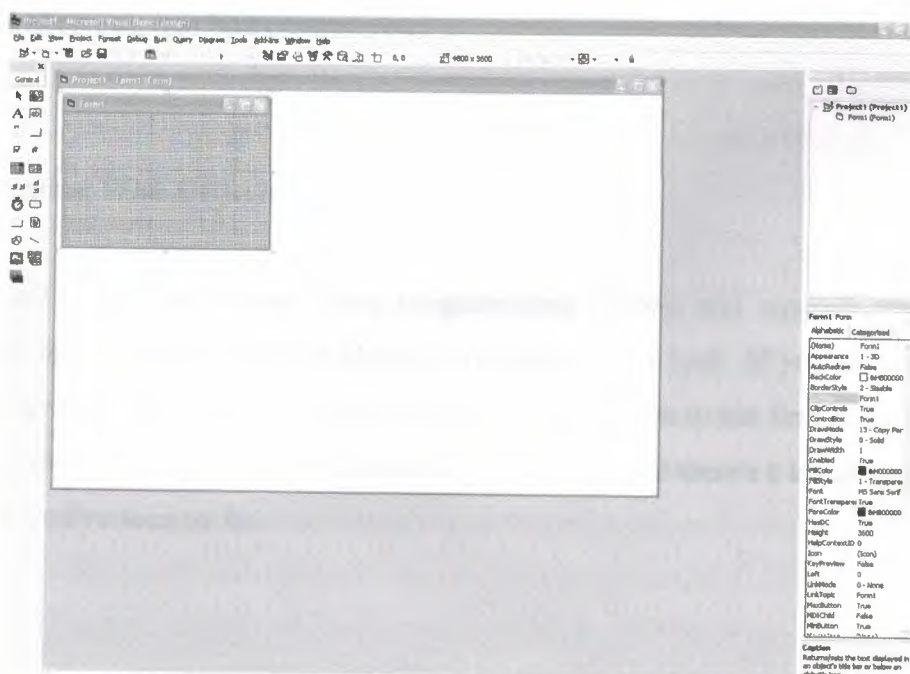

Figure 1.1

Before you begin designing the user interface, you need to think about the purpose of the application. The design for a primary application that will be in constant use should

be different from one that is only used occasionally for short periods of time. An application with the primary purpose of displaying information has different requirements than one used to gather information.

The intended audience should also influence your design. An application aimed at beginning user demands simplicity in its design, while one for experienced users may be more complex. Other applications used by your target audience may influence their expectations for an application's behavior. If you plan on distributing internationally, language and culture must be considered part of your design.

1.8.2 Using Visual Basic Standard Controls:

You use controls to get user input and to display output. Some of the controls you can use in your applications include text boxes, command buttons, and list boxes. Other controls let you access other applications and process data as if the remote application was part of your code. Each control has its own set of properties, methods, and events. Ex: Control arrays, text box controls, etc.

Programming With Objects:

Objects are central to Visual Basic programming. Forms and controls are objects. Databases are objects. There are objects everywhere you look. If you've used Visual Basic for a while, or if you've worked through the examples in the first five chapters of this book, then you've already programmed with objects but there's a lot more to objects than what you've seen so far.

Programming With Components:

Do you sometimes need to provide the same analysis and calculation capabilities as Microsoft Excel in your Visual Basic application? Or, perhaps you'd like to format a document using Microsoft Word formatting tools, or store and manage data using the Microsoft Jet database engine. Even better, would you like to be able to create or buy standard components, and then use them in multiple applications without having to modify them? All this and more can be accomplished by building your applications using ActiveX components. An ActiveX component is a reusable piece of programming code and data made up of one or more objects created using ActiveX technology. Your applications can use existing components, such as those included in Microsoft Office applications, code components, ActiveX documents, or ActiveX controls (formerly called OLE controls) provided by a variety of vendors. Or, if you have the Visual Basic, Professional or Enterprise Edition, you can create your own ActiveX controls. For components that support object linking and embedding, you can insert objects into your application without writing any code by using the component's visual interface. You can insert an OLE-enabled object into your application by using the OLE container control or by adding the object's class to the Toolbox. To fully understand ActiveX components, you should first be familiar with how to work with classes, objects, properties, and methods, which are explained in "Programming with Objects."

Responding to mouse and keyboard Event:

Your Visual Basic applications can respond to a variety of mouse events and keyboard events. For example, forms, picture boxes, and image controls can detect the position of the mouse pointer, can determine whether a left or right mouse button is being pressed, and can respond to different combinations of mouse buttons and SHIFT, CTRL, or ALT keys. Using the key events, you can program controls and forms to respond to various key actions or interpret and process ASCII characters.

In addition, Visual Basic applications can support both event-driven drag-and-drop and OLE drag-and-drop features. You can use the Drag method with certain properties and events to enable operations such as dragging and dropping controls. OLE drag and drop

gives your applications all the power you need to exchange data throughout the Windows environment and much of this technology is available to your application without writing code.

You can also use the mouse or keyboard to manage the processing of long background tasks, which allows your users to switch to other applications or interrupt background processing.

Working with Texts and Graphics:

Visual Basic includes sophisticated text and graphics capabilities for use in your applications. If you think of text as a visual element, you can see that; size, shape and color can be used to enhance the information presented. Just as a newspaper uses headlines, columns and bullets to break the words into bite-sized chunks, text properties can help you emphasize important concepts and interesting details.

Visual Basic also provides graphics capabilities allowing you great flexibility in design, including the addition of animation by displaying a sequence of images.

Debugging your code and handling Errors:

No matter how carefully crafted your code, errors can (and probably will) occur. Ideally, Visual Basic procedures wouldn't need error-handling code at all. Unfortunately, sometimes files are mistakenly deleted, disk drives run out of space, or network drives disconnect unexpectedly. Such possibilities can cause run-time errors in your code. To handle these errors, you need to add error-handling code to your procedures.

Sometimes errors can also occur within your code; this type of error is commonly referred to as a bug. Minor bugs: for example, a cursor that doesn't behave as expected can be frustrating or inconvenient. More severe bugs can cause an application to stop responding to commands, possibly requiring the user to restart the application, losing

whatever work hasn't been saved. The process of locating and fixing bugs in your application is known as debugging. Visual Basic provides several tools to help analyze how your application operates. These debugging tools are particularly useful in locating the source of bugs, but you can also use the tools to experiment with changes to your application or to learn how other applications work.

Accessing Data:

Almost all applications require some form of data storage and manipulation, and Visual Basic provides a number of tools to meet these needs, including the data control and data-bound controls, data access objects, remote data objects, and the remote data control.

Designing for Performance and Compatibility:

In an ideal world, every user of your applications would have a computer with the fastest possible processor, plenty of memory, unlimited drive space, and a blazingly fast network connection. Reality dictates that for most users, the actual performance of an application will be constrained by one or more of the above factors. As you create larger and more sophisticated applications, the amount of memory the applications consume and the speed with which they execute become more significant. You may decide you need to optimize your application by making it smaller and by speeding calculations and displays.

As you design and code your application, there are various techniques that can be used to optimize the performance. Some techniques can help to make your application faster; others can help to make it smaller. In this chapter I will explain some of the more common optimization tricks that you can use in your own applications.

Visual Basic shares most of its language features with Visual Basic for Applications, which is included in Microsoft Office and many other applications. Visual Basic, Scripting Edition (VBScript), a language for Internet scripting, is also a subset of the

Visual Basic language. If you're also developing in Visual Basic for Applications or VBScript, you'll probably want to share some of your code between these languages.

International Issues:

If you are planning to distribute your Visual Basic application to an international market, you can reduce the amount of time and code necessary to make your application as functional in its foreign market as it is in its domestic market. This chapter introduces key concepts and definitions for developing international applications with Visual Basic, presents a localization model, and emphasizes the advantages of designing software for an international market.

Distributing Your Application:

Once you have created a Visual Basic application, you may want to distribute it to others. You can freely distribute any application you create with Visual Basic to anyone who uses Microsoft Windows. If you are going to distribute your application, you will need to write or use a setup program that installs your application onto a user's machine.

1.8.3 Used Components

I am going to explain some components, which are used for this project. All this components contains its own .OCX files, so user can register this files to use new components. Following components are commonly used for projects and also they used for "Periodics Control System" and "Book Control System" programs that which were written by me.

Command Button:

Most Visual Basic applications have command buttons that allow the user to simply click them to perform actions. When the user chooses the button, it not only carries out the appropriate action, it also looks as if it's being pushed in and released. Whenever the user clicks a button, the Click event procedure is invoked. You place code in the Click event procedure to perform any action you choose.

A Label:

A label control displays text that the user cannot directly change. You can use labels to identify controls, such as text boxes and scroll bars that do not have their own caption property. The actual text displayed in a label is controlled by the Caption property, which can be set at design time in the Properties window or at run time by assigning it in code. By default, the caption is the only visible part of the label control. However, if you set the BorderStyle property to one (which you can do at design time), the label appears with a border giving it a look similar to a text box. You can also change the appearance of the label by setting the BackColor, BackStyle, ForeColor, and Font properties.

Text Box:

Text boxes are versatile controls that can be used to get input from the user or to display text. Text boxes should not be used to display text that you don't want the user to change, unless you've set the Locked property to true. The actual text displayed in a text box is controlled by the Text property. It can be set in three different ways: at design time in the Property window, at run time by setting it in code or by input from the user at run time. The current contents of a text box can be retrieved at run time by reading the Text property.

Option Button:

Option buttons present a set of two or more choices to the user. Unlike check boxes, however, option buttons should always work as part of a group; selecting one option button immediately clears all the other buttons in the group. Defining an option button group tells the user, "Here is a set of choices from which you can choose one and only one."

List box:

List boxes and combo boxes present a list of choices to the user. By default, the choices are displayed vertically in a single column, although you can set up multiple columns as well. If the number of items exceeds what can be displayed in the combo box or list box, scroll bars automatically appear on the control. The user can then scroll up and down or left to right through the list.

Timer:

Timer is used to make some operation in a specific time interval. Time interval can be adjusted from the properties of the timer.

Microsoft HFlexGrid Control 6.0:

The HFlexGrid Displays and enables data manipulation of a series of rows and columns representing records and fields from a Recordset object. The DataGrid control's Columns collection's Count Property and the Recordset object's RecordCount property to determine the number of columns and rows in the control. A DataGrid control can have as many rows as the system resources can support and up to 32767 columns.

Microsoft ADO data control 6.0:

In Visual Basic, three data access interfaces are available to you: ActiveX Data Objects (ADO), Remote Data Objects (RDO), and Data Access Objects (DAO). A data access interface is an object model that represents various facets of accessing data. Using Visual Basic, you can programmatically control the connection, statement builders, and returned data for use in any application.

xv

Frame:

A Frame control provides an identifiable grouping for controls. You can also use a Frame to subdivide a form functionally—for example, to separate groups of Option Button controls.

2 DATABASE MANAGEMENT

2.1 Tools

With this table information of Tools holds. There are Basliklar and itemNo fields in this tools table. The table is shown below:

3 THE MAIN PROGRAM (MAG.EXE)

When the program is run, first time this window views.

3.1 Beginning Form

Figure 3.1

The user must choose admin or normal. If the user wants to add, change and delete, it must choose admin, but the user must know the admin password. If it is choosing “Normal”, they can only look at the information of the members and create the special reports and add the new member. But they can not change information of any members.

If the user click “>>” on the form, the form is be as like figure 3.2.

Figure 3.2

In here; the user can change web address of the program and what it know which language. After clicking “ok”, the main window is open.

3.2 Main Window

Figure 3.3

In left side the user is searching results. If it is write any alphabetic, all of the member's names are add in list box In right the user is look at the information of the member.

I am telling another buttons in follow.

3.2.1 Click “Settings”

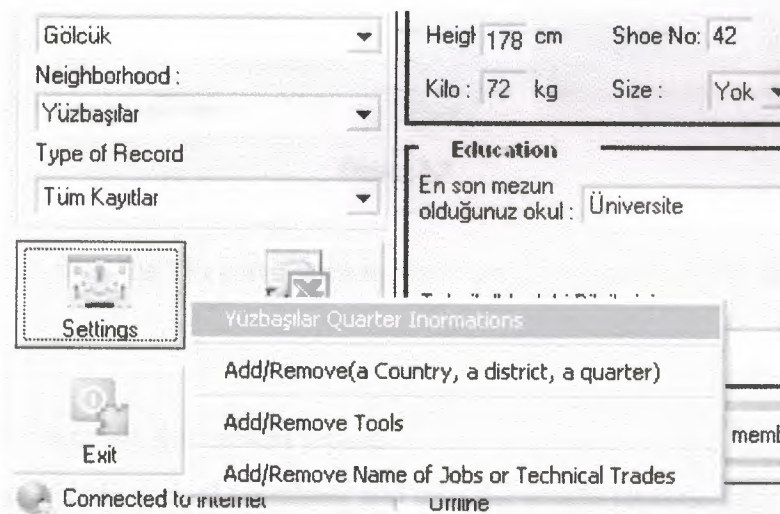

Figure 3.4

When the user is click the “Settings” button, there are four options for it. In here, it can choose those:

- The user can change the information of the choosing quarter.
- Add/Remove (a country, a district, a quarter): the user can add or remove any country or any district or any quarter.

Figure 3.6

3.3 Settings form

3.3.1 Add a country

If the country has not the database, the user must add it in the database.

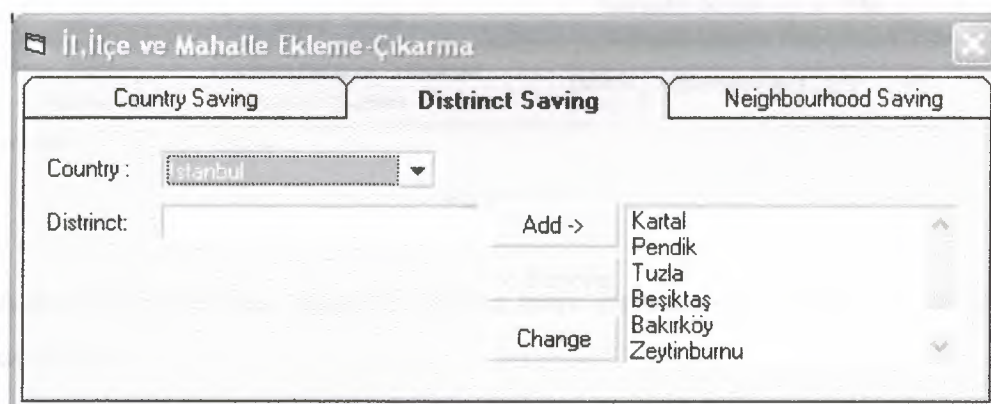

The screenshot shows a software window titled "İl, İlçe ve Mahalle Ekleme-Çıkarma" with a close button in the top right. It has three tabs: "Country Saving", "District Saving", and "Neighbourhood Saving". The "Country Saving" tab is active. It contains a "Country:" label, a text input field, and three buttons: "Add ->", "Change", and "Cancel". To the right of the buttons is a list box containing "Kocaeli", "İstanbul", and "Yalova".

Figure 3.7

3.3.2 Add a district

If the district has not the database, the user must add it in the database.

The screenshot shows the same software window, but the "District Saving" tab is active. The "Country:" label is followed by a dropdown menu showing "İstanbul". Below it, the "District:" label is followed by a text input field. To the right of the input field are the "Add ->", "Change", and "Cancel" buttons. Further right is a list box containing "Kartal", "Pendik", "Tuzla", "Beşiktaş", "Bakırköy", and "Zeytinburnu".

Figure 3.8

3.3.3 Add a quarter

If the quarter has not the database, the user must add in the database.

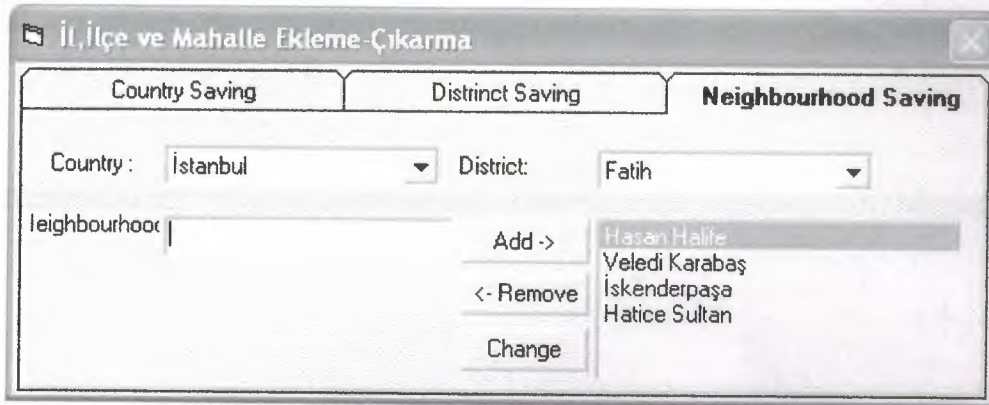

Figure 3.9

3.4 Present reports

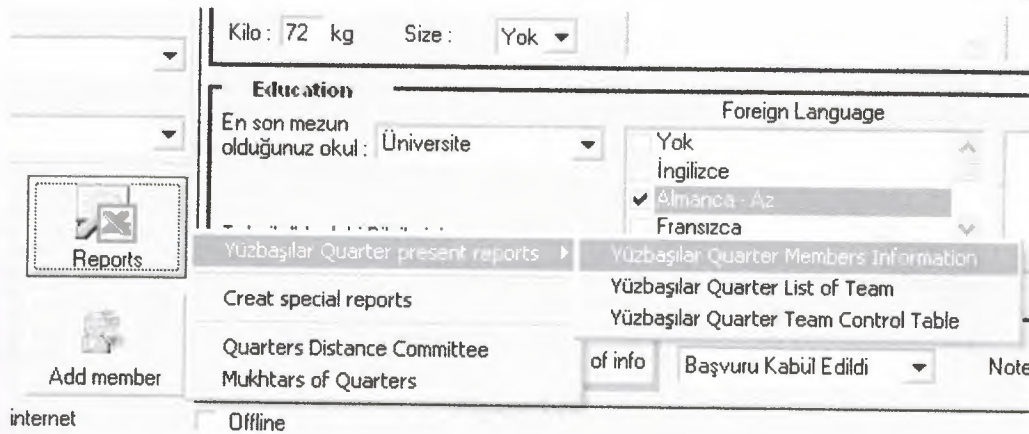

Figure 3.10

When the user is click the “Reports” button, there are three options for it. In here, it can choose those:

- It can take a report of member’s information for chooses the quarter.
- It can take a report of List of Team for chooses the quarter.
- It can take a report of Team Control Table for chooses the quarter.

3.4.1 Members information

In here, it can take a report of member's information on the screen as like figure 3.11.

3.4.3 Team Control Table

In here, it can change the information and take a report of Team Control Table on the screen as like figure 3.13.

The screenshot shows a software window titled 'Ekip Genel Kontrol Tablosu'. Inside, there's a subtitle 'Yüzbaşılar Mahallesi Ekip Genel Kontrol Tablosu'. Below the subtitle are three dropdown menus: 'Yıl 2005', 'Mon Haziran', and 'Edit', followed by 'Printer' and a 'Close' button. The main area contains a table with 4 columns: 'No', 'Adı Soyadı', 'Attendance a meeting', 'Ekipman service', and 'Aktivitelere'. The table lists 20 team members, each with a number and name, and checkboxes for each of the three activity columns. The table is scrollable, with a vertical scrollbar on the right.

No	Adı Soyadı	Attendance a meeting	Ekipman service	Aktivitelere
1:	Adnan Demir	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

3.5.4 The Help

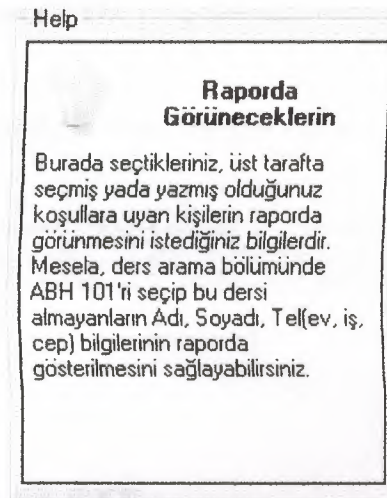

Figure 3.18

4 THE AUTOUPDATE.EXE

This program is taskbar program. For every 15 seconds it controls update of the database in the web host.

Figure 4.1

Figure 4.2

5 THE MAGFTP.EXE

When “mag.exe” or “autoupdaete.exe” find the new version in web host for the program, they run “magftp.exe”. The program automatically logs in the host and starts download the new files.

Figure 5.1

6 THE CHANGEFILES.EXE

When the magftp.exe program is finish download, automatically started this changefile.exe. Because the downloaded files has to change file names.

Figure 6.1

CONCLUSION

Nowadays, windows oriented programs became more popular and flexible. Visual Basic 6.0 is one of the best well-known programming languages based on window's environment. That's why I prefer this project. Now I can understand why these programming languages are very popular. Even I do not have experience with Visual Basic; this project did not become difficult to me. Visual Basic 6.0 has lots of help than other programming languages.

In my project, I have used important components of Visual Basic 6.0. Therefore I learned these components very well. Now I can use these components of Visual Basic 6.0 in an efficient manner. Also I have learned how to use new data access logic, which is ActiveX Data Objects (ADO). Additionally, I have used a database in my project. So I have gained many practices, experiences and knowledge of database. As known, database is very important topic for software programmers.

Finally, most important thing is for me that I have learned how to prepare an individual software project by using Visual Basic 6.0 to real life problems. After I have started my projects, I saw that you could face with unexpected real life problems. These real life problems are very different from the courses problem. This project became a good exercise to me for the real life and I used the things in my project that I learned from courses as theoretically.
