ACKNOWLEDGMENT

ABSTRACT

First of all I would like to thank God for guiding me through my education.

Also I dedicate my graduation and this book and my success to my family, thanks to God I succeeded and made one of their wishes come true.

More over I feel proud to pay my special regards to my project supervisor Dr.Nadire Çavus. She never disappointed me in any affair. She delivered too much information to me and did hers best efforts to make me able to complete my graduation project. She has divine place in my heart. I am really thankful to her.

Also, I want to pay special regards to all of my family who are enduring all of these expenses and supporting me in all events, Could do nothing without their prayers. They always encouraged me in all crises and through all issues. I will never forget their sacrifices for me to complete my education so that I can enjoy my successful life as they expect.

I also want to honor all of these people who gave me all the knowledge that I needed during my education period specially the head of faculty and the chairman of the computer information department Dr.Yalcin Akcali.

I also want to pay my special thanks to my friends who was always supporting me and advised me about facing all the difficulties I had during my life time in Cyprus.

ABSTRACT

INTRODUCTION

This project is an implementation of Visual Basic in the mobiles sales section; here we use a Visual Basic application to manage a mobiles shop with all possible actions and characteristics like customers, stocks, users and receipts.

This project uses Microsoft Visual Basic 6.0, Microsoft Access Database and Structured Query Language (SQL) queries to manipulate the database.

The aim of this project is to help the user to manage the data storage and use it when it is needed.

Customers pass by in mobile shop to search for the best quality of mobiles and prices, some customers pay in cash and some pay by using credit cards. So the selling operation must be managed and controlled daily. On the other hand the company must hire employees with full information about them in which they can help the customers in finding the best cell phones and writing full information about the stock sells with the customer information.

This program helps user to manage the whole information in general and save it in database so they can use it later when it's needed

EXPLANATION

INTRODUCTION

This project describes database system concepts and a simple computer shop program which named computer shop. The application part uses Access and SQL quires. The program is written by Microsoft Visual Basic 6.0 and Microsoft Access to create database and uses SQL queries.

Describes the program execution and basics about purchasing and selling mobiles related accessories and stocks and the use of a mobile shop management system.

EXPLANATION

The minimum requirements of the system are as follows:

Intel Pentium III processor

550 Mhz

128MB of RAM

30 GB harddisk

14" Monitor

Microsoft Windows 2000

LG CD-ROM CRD 8522B

DAVIDOM 9102-BASED PCI Fast Ethernet Adapter

The recommended requirements of the system are as follows:

Intel Pentium IV processor

800Mhz

256MB of RAM

60 GB harddisk

17" Monitor

Microsoft Windows XP Professional

LG CD-ROM CRD 8522B

DAVID OM 9102-BASED PCI Fast Ethernet Adapter

I used Visual Basic programming language for writing this project and Sql And Access database for keeping the data and maintaining it.

MOBILE SHOP SYSTEM

1. PROJECT IDENTIFICATION AND SELECTION

THE AIM OF THE PROJECT:

The Mobile shop system, aims to serve the customers and suppliers who come to shop for mobile and its accessories and the to provide better satisfaction services to the buying customers and the suppliers.

The existing systems handicaps, the easiness and flexibility that the new system wishes to bring to the users are explained in detail under the headlines ``The Existing System Capabilities`` and ``New system Providences``.

THE PROJECT BOUNDARIES:

1. This system has users identifications with information of existing and adding a new user .
2. There is also customers detail in which stored in data.
3. The companies or suppliers information is also stored from which buyer what we bought.
4. There is stocks which means products in which we have our mobiles accessories.
5. This is the Receipts in which we have the sales of products to customers and the products we bought from companies.

RESOURCE LIMITS:

The budget and system is cheap for the users who are working in the shop to help the customers.

2 . PROJECT INITIATION AND PLANNING

TECHNICAL FEASIBILITY:

- Computers for the existing user,
- Computers for the new user,
- Computer and printer for payment receipts.

Besides these hardwares , some hardwares and softwares for the new network system that will be applied and afforded as well.

OPERATIONAL FEASIBILITY:

A test has been made among the users who will be working in the shop so they have the basic knowledge about computers and they should know about the system.

ECONOMICAL FEASIBILITY:

All the expenses will be afforded by the owner of the shop or user.

3. ANALYSIS

THE REQUIREMENT DETERMINATION:

The requirement made by the user are as follows:

- To increase the speed of operation
- To prevent loss of data
- To prevent easy and quick data access
- To restrict data access with the means of system security.

NEW SYSTEMS PROVIDENCES

- The new system will help the users to enter the customer or suppliers data in the database.
- The system will be accessed by only authorized users. The customer and companies info or details can only be changed by the user.
- All data will be kept in and stored in the computer database.
- Users can see through the database the list of customers and companies who bought and have history of all the sales.

SYSTEM DEFINITION:

Mobile Shop is a business where we buy and sell mobiles like sim cards, headphones, accessories etc such as buying new mobiles from the companies or selling to the local people and then sell them with a bit higher price to make profit.

Solution:

The system defined above works in both fields that is buying and sale as well as keeps the track of its customer's records too. Mainly I divide the system into five (6) main processes.

1. User Identifications

2. Stocks

3. Companies

4. Customers

5. Receipts

6. Reports

Each of this process is explained in detail below.

USERS IDENTIFICATION: The form contains the users and their login names and passwords and their information, here there is user type which defines the restriction level for every user.

STOCKS: In this form we can edit update accessories like sim cards top up cards and mobiles.

COMPANIES: In this form we add companies that produces mobiles and sells it to us so we sell it to other customers and edit or delete or update also.

CUSTOMERS: In this form it shows us the details of a customer who is willing to buy a product from the shop. In this we can add delete and update customers in the database.

RECEIPTS:

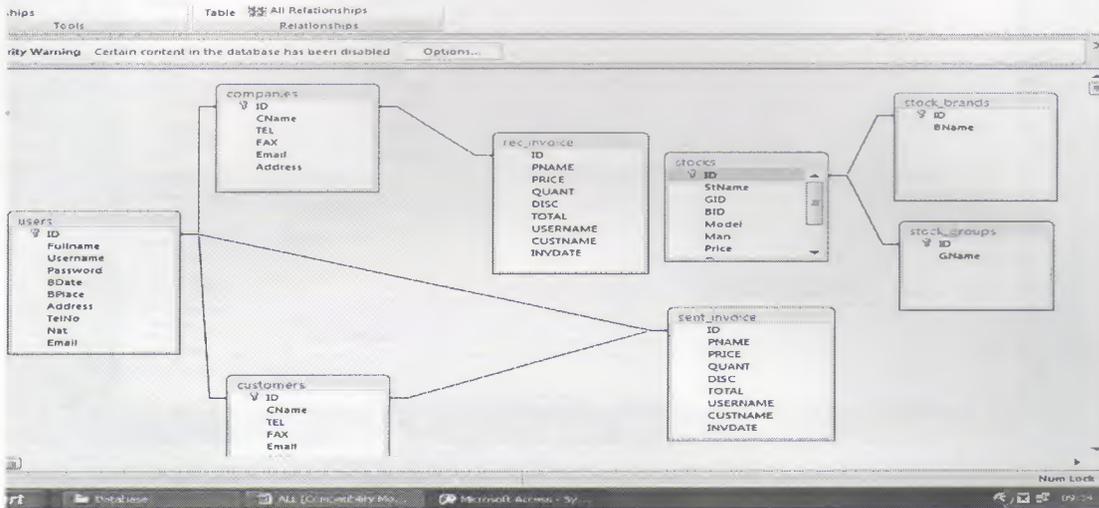

Sent Invoice Receipt: It is given to the customers to which customer the product is sold. Also the username will be saved and printed with the receipt for security reasons.

Receipt Invoice Receipt: It is given to the companies we buy merchandise from and we do not select customer name, we select companies name.

REPORTS: It shows the companies and customers report.

SYSTEM DESIGN

Relationships

Users

The screenshot shows the Microsoft Access Field Properties dialog box for the 'users' table. The 'Field Name' is 'ID' and the 'Data Type' is 'Number'.

Field Name	Data Type	Description
ID	Number	
Fullname	Text	
Username	Text	
Password	Text	
BDate	Date/Time	
BPlace	Text	
Address	Text	
TelNo	Text	
Nat	Text	
Email	Text	

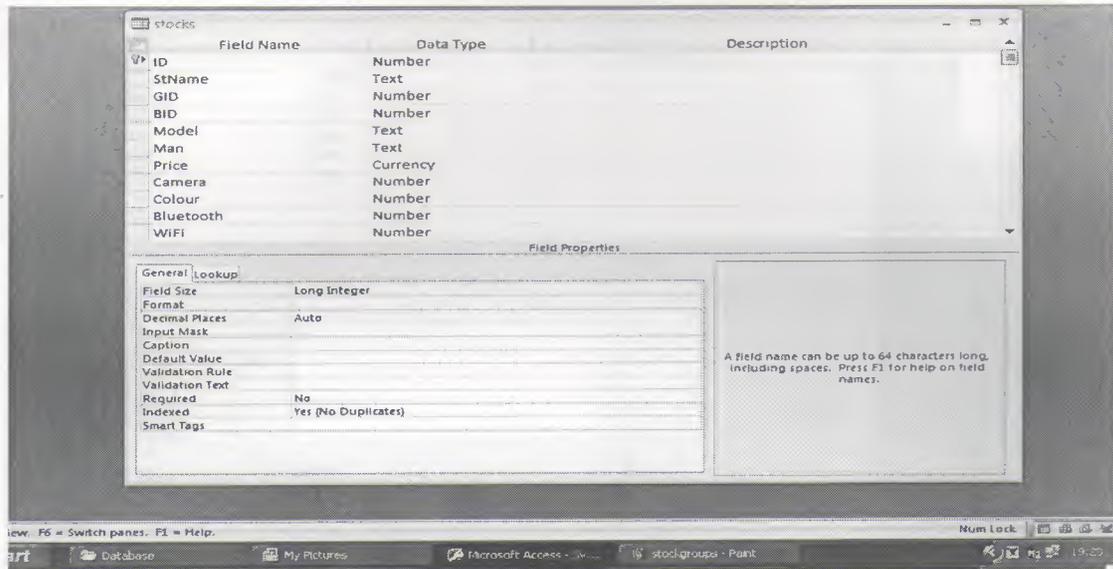

Field Properties

USER MANUAL

USER GUIDELINES

Microsoft visual Basic 6.0 has many special tools to create a project after opening the visual basic , a form is displayed to ask the user what kind of project is to be selected,

Click standard EXE then (open)button

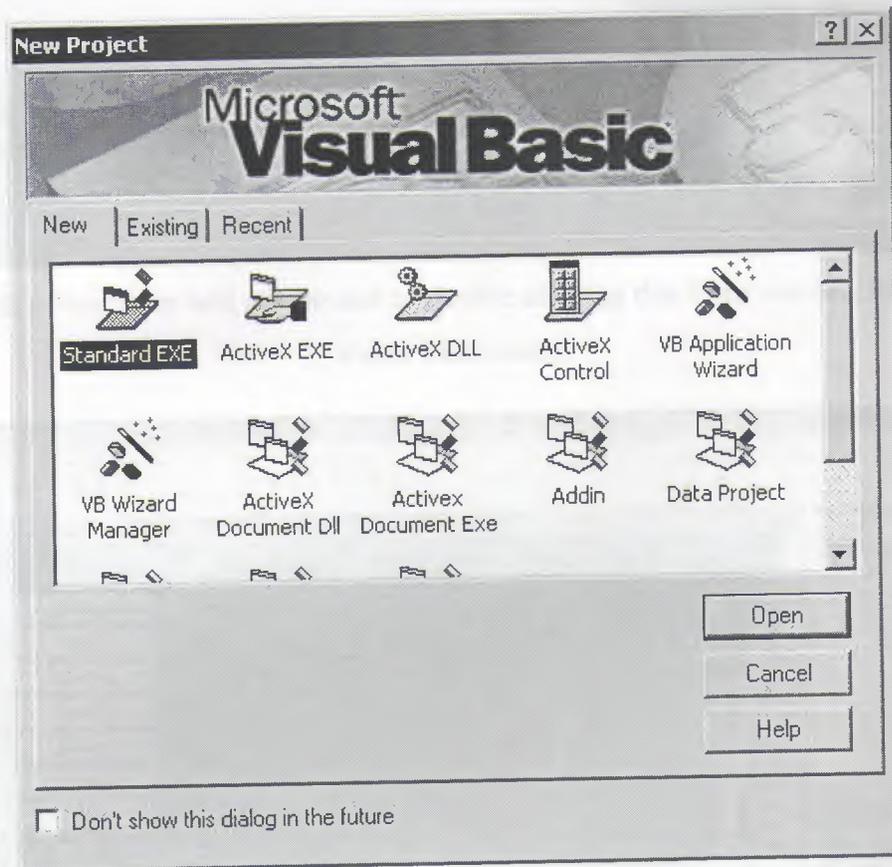

Figure 01 Starting a New Project

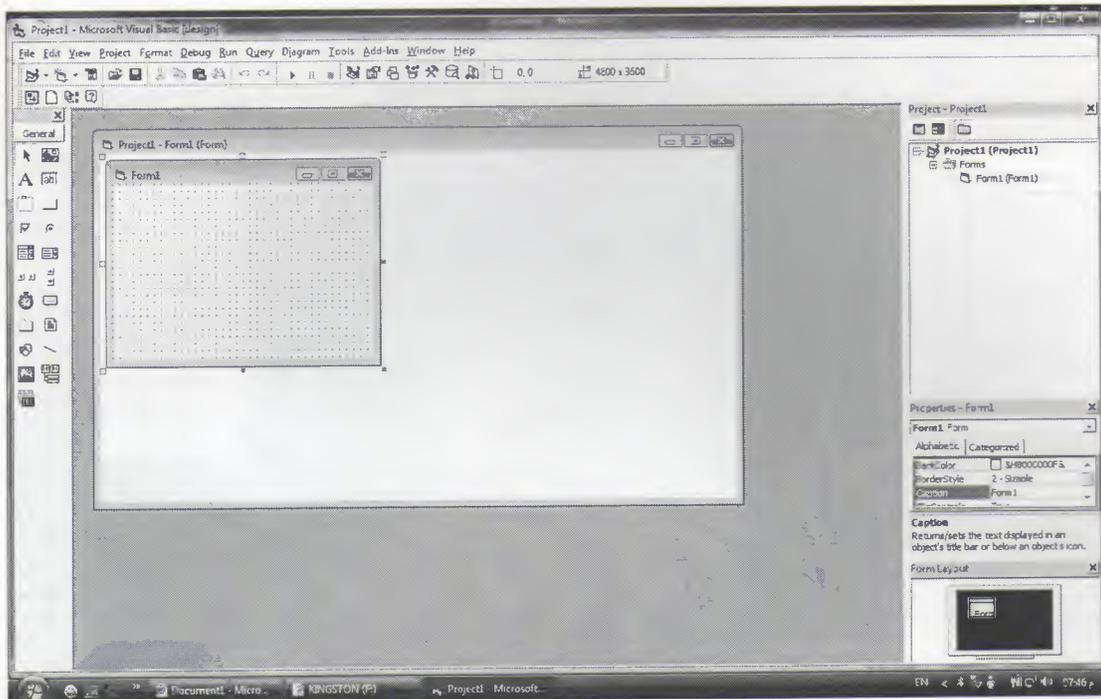

Figure 02 a New form will appear and by double clicking this form you can start writing visual basic codes.

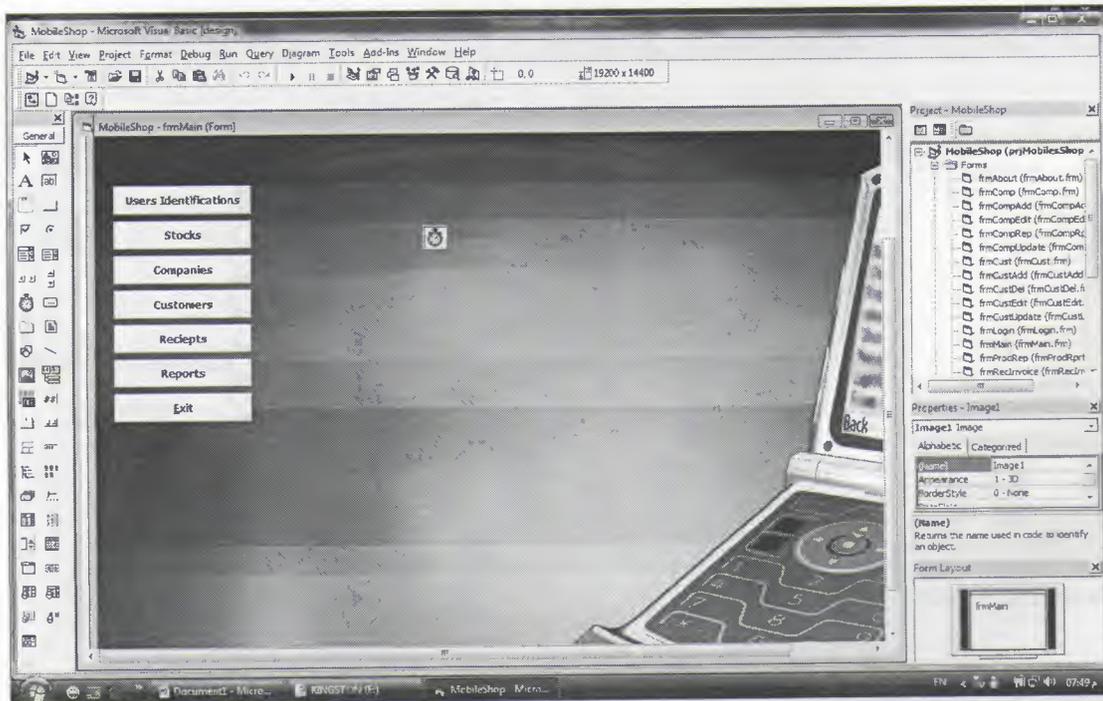

Figure 03 After finishing with writing the codes click the start button from the visual basic menu or easily press F5 button from keyboard. The program will start running unless there are errors on the code.

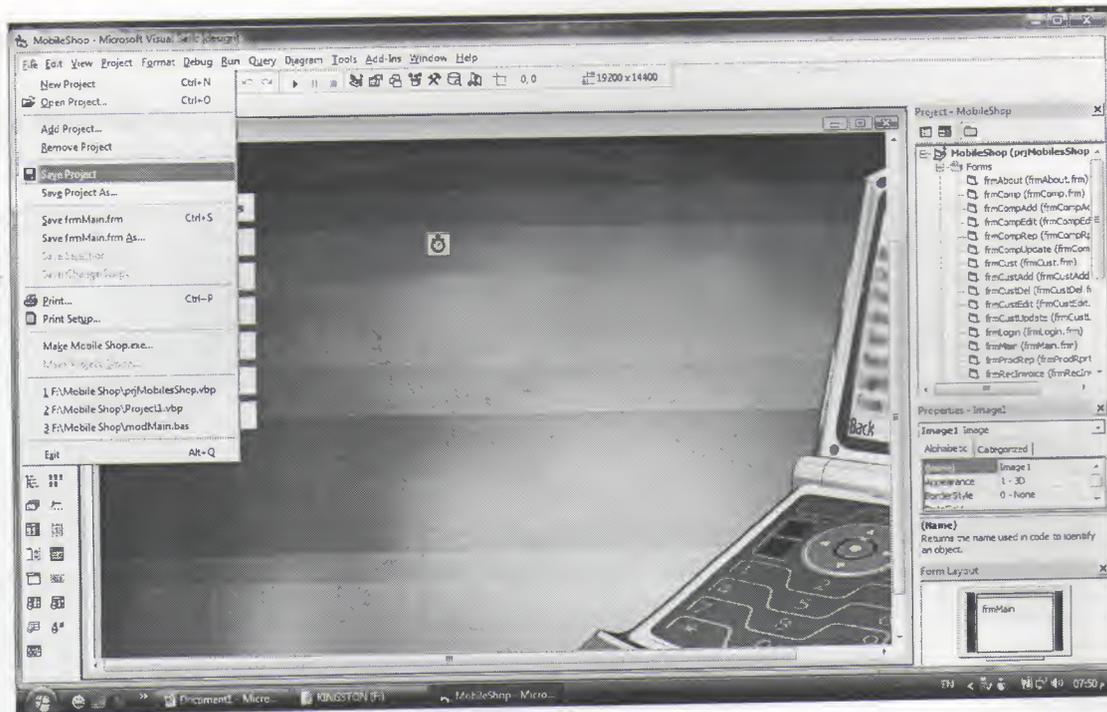

Figure 04 After testing the project if everything works fine click the visual basic menu file and then save project button, all the changes will be saved.

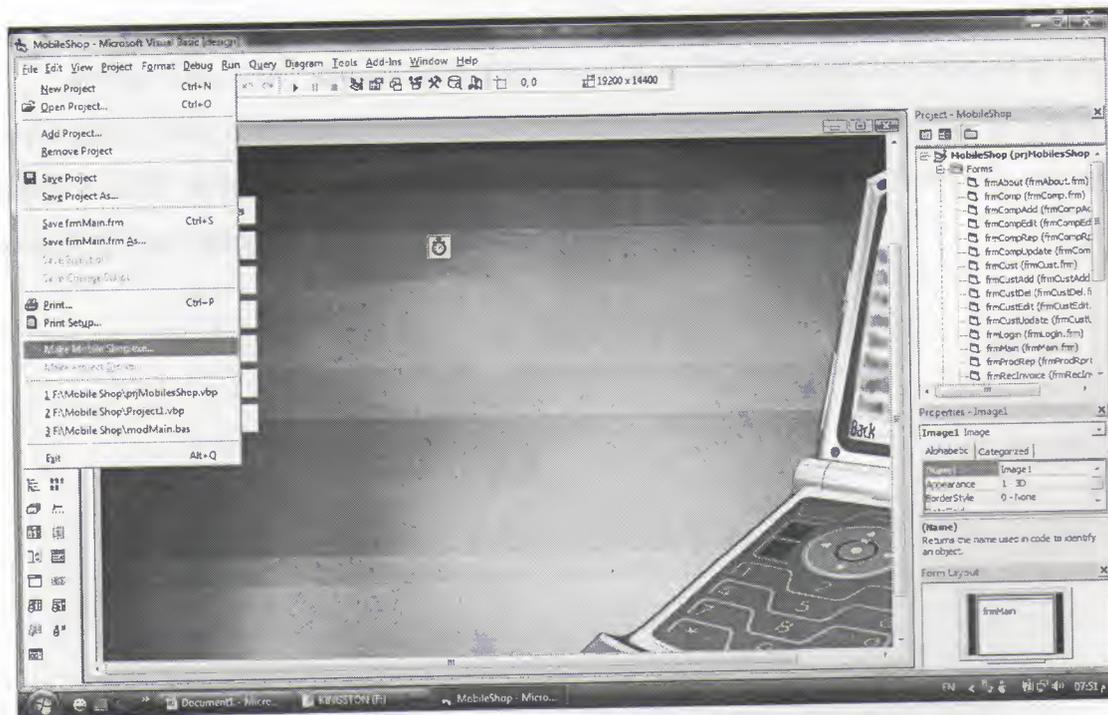

Figure 05 Saving a project and making a executable file of the project is very easy. by clicking file menu of visual basic then select make EXE selection here.

DESCRIPTION OF FORMS

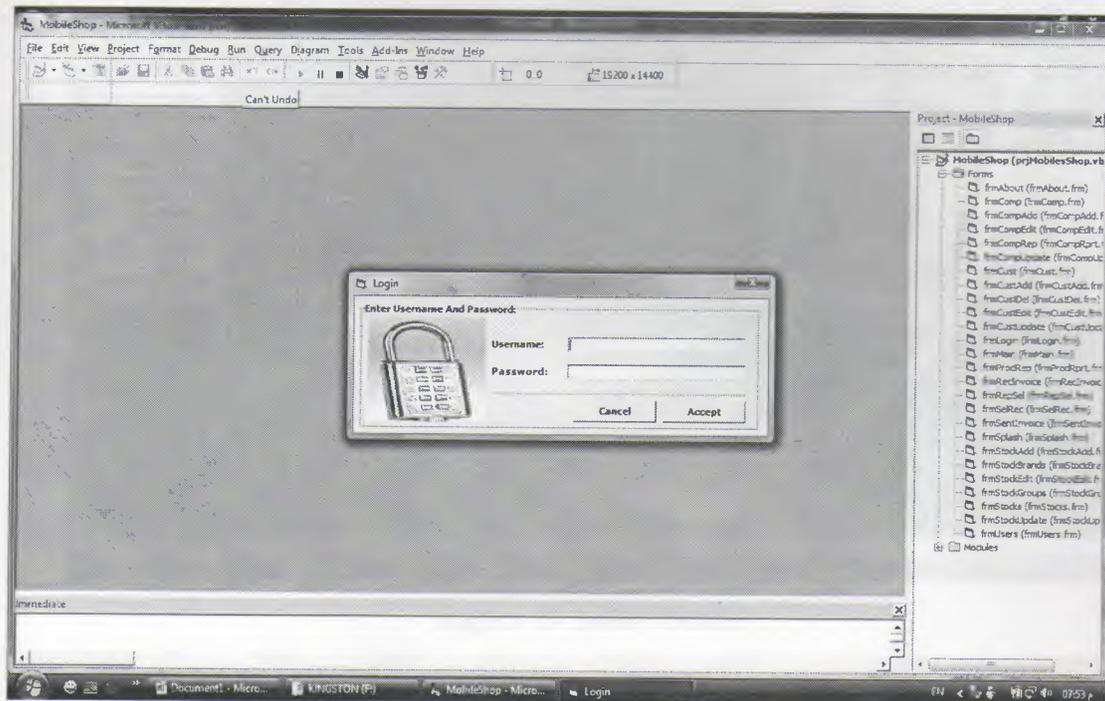

Figure 06 Login Form

In this form users should enter their users name and password to be able to access the program, if the user typed a wrong user name or password a message will be displayed saying invalid user name or password, otherwise the user will enter the program successfully and there are three types of users, admin, users, and guest.

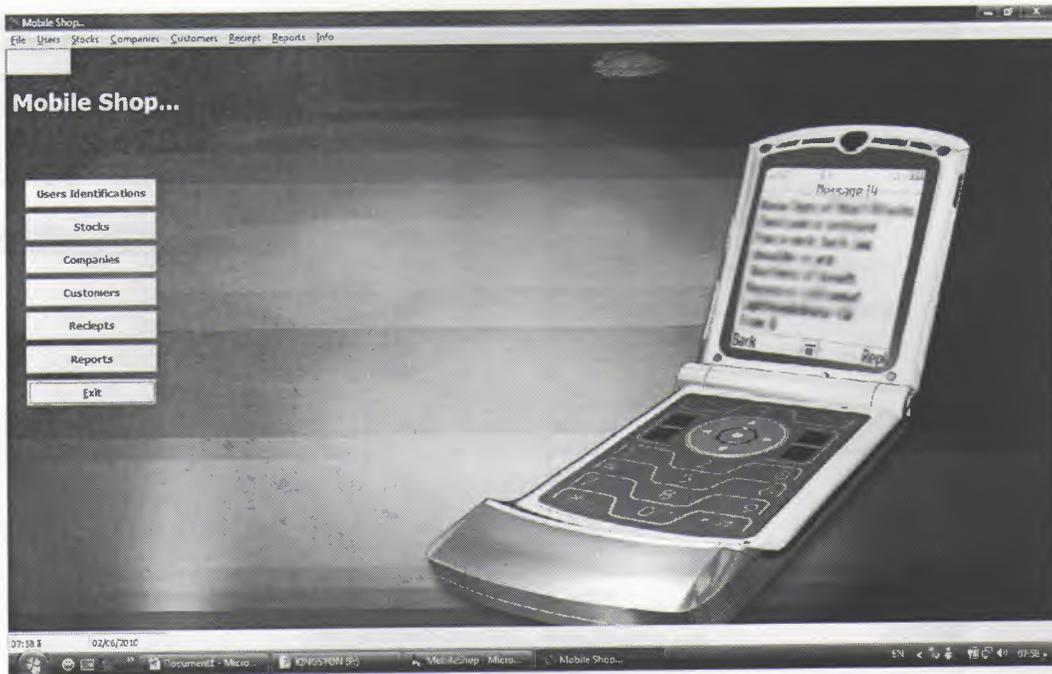

Figure 07 Main Menus.

This is the main menu form, in this form there are 7 menus and each menu access a different section where you can do different operations.

For the file menu there is the exit menu which will exit the program, for the users menu it will lead you to users identifications, for the stocks menu it will lead you to add stock menu, update stock, stock groups and stock brand names, for the companies menu it will lead you to add supplier menu and update supplier menu. For the customers menu it will lead you to add customer menu and update customer menu. The receipt menu it will lead you to add customer menu and update customer menu. There receipt menu contains customer receipt and supplier receipt. Finally the head menu which contain the about menu.

Figure 08 Users Identifications

This form contains the users and their login names and passwords and their information, here there is user type which defines the restriction level for every user.

Figure 09 Add Stock

This form adds a new stock to the database using embedded SQL queries.

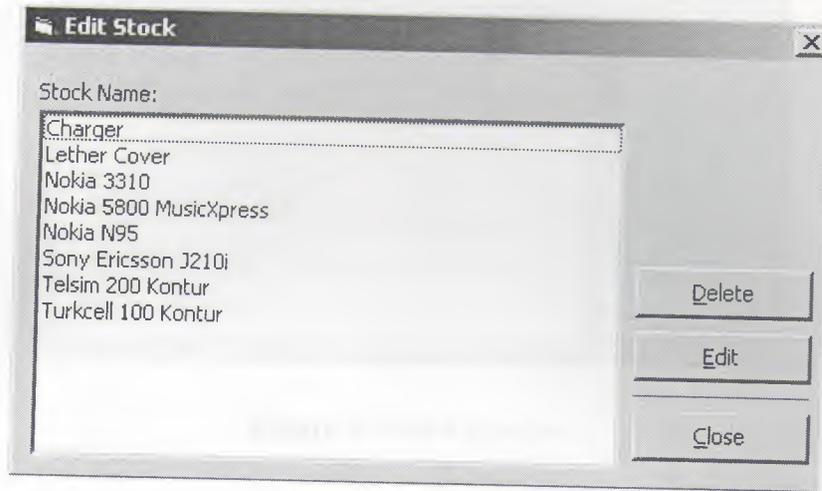

Figure10 Edit Stock

In this form we can select the stock we want to edit then we will edit in the update stock form in figure 5.11

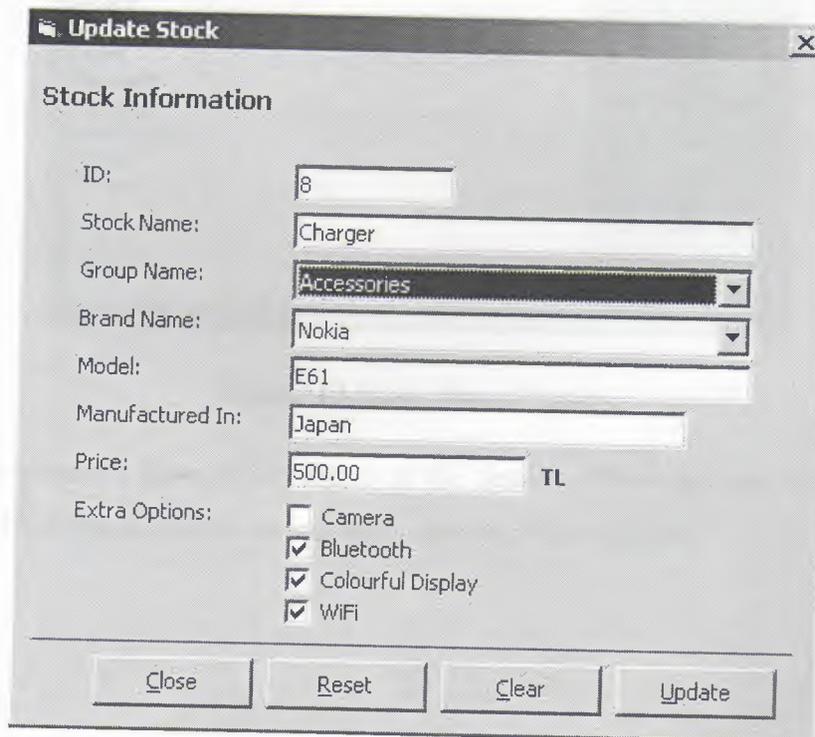

Figure 11 Update Stock

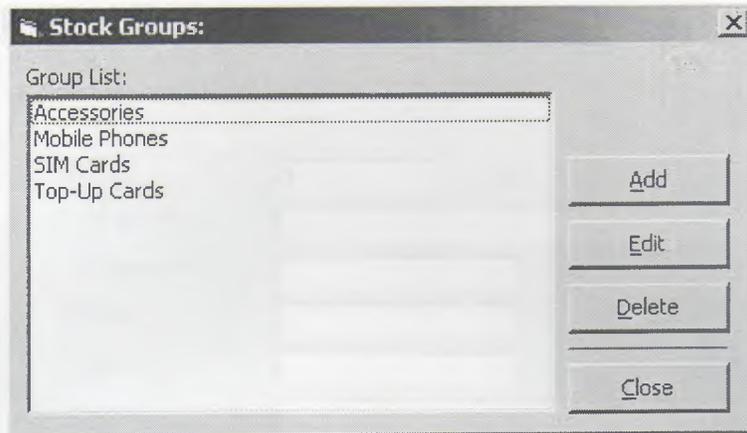

Figure 12 Stock Groups

This is the stock groups form which groups different types of stocks like mobile, mobile accessories.

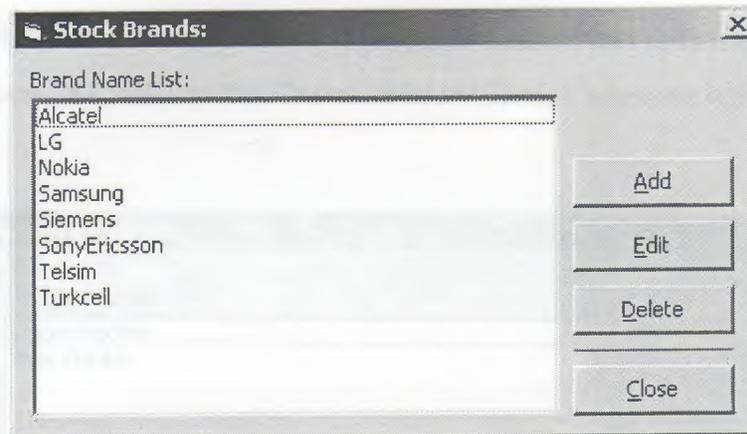

Figure 13 Stock Brand Names

This is a customer form which shows us the details of the customer who is willing to buy a mobile from the shop here we can add customer information.

Add Company

Add Company Information

ID: 3

Company Name:

Telephone No:

Fax No:

E-mail:

Address:

Close Clear Add

Figure 14 Add Company

In this form we add companies that produces mobiles and sells it to us so we sell it to other customers , we will use this Customer Identification when we write a received invoice.

Edit Company

Company Name:

Golden Mobiles

Ybler Mobiles

Delete

Edit

Close

Figure 15 Edit Company

Here we can see all defined companies as we can see we can select a customer by clicking on it's name and then we can delete it like in the figure 5.16 or we can update it like in the figure 5.17

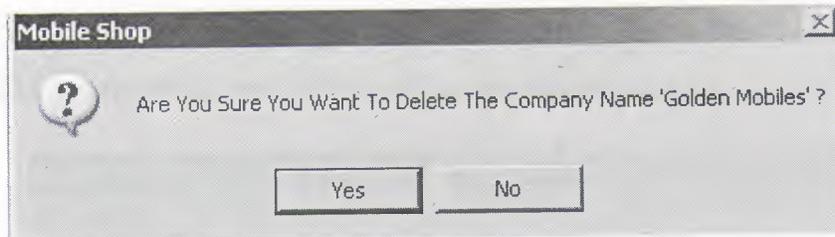

Figure 16 Delete Company

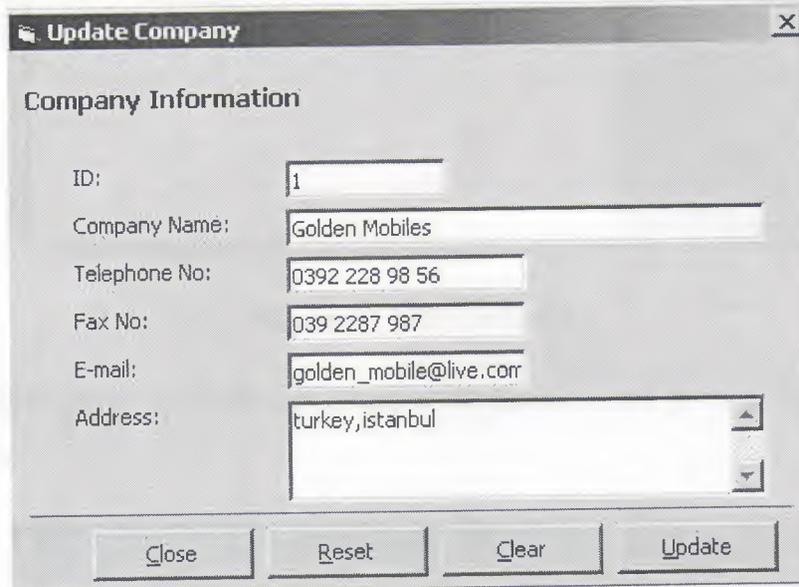

Figure 17 Update Company

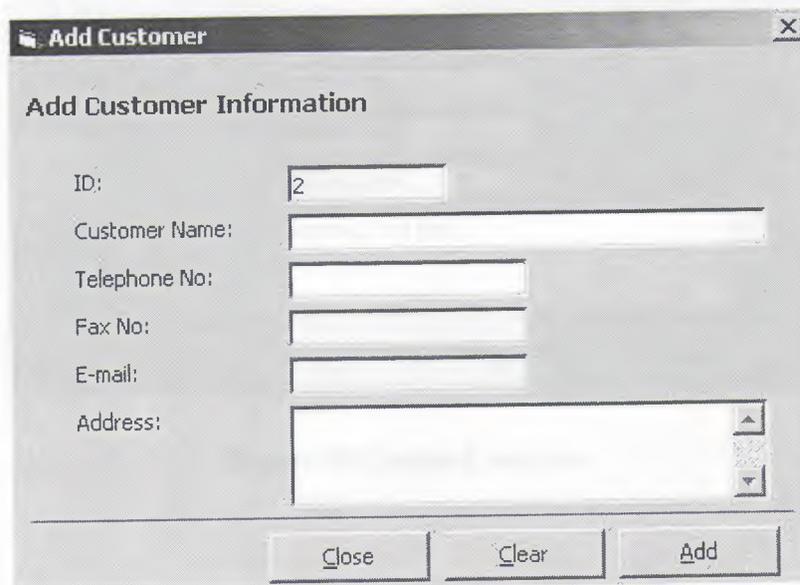

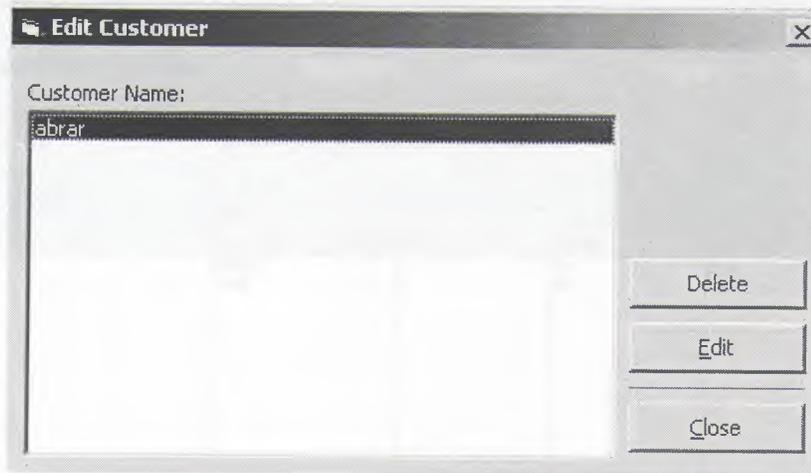

Figure 18 Add Customer

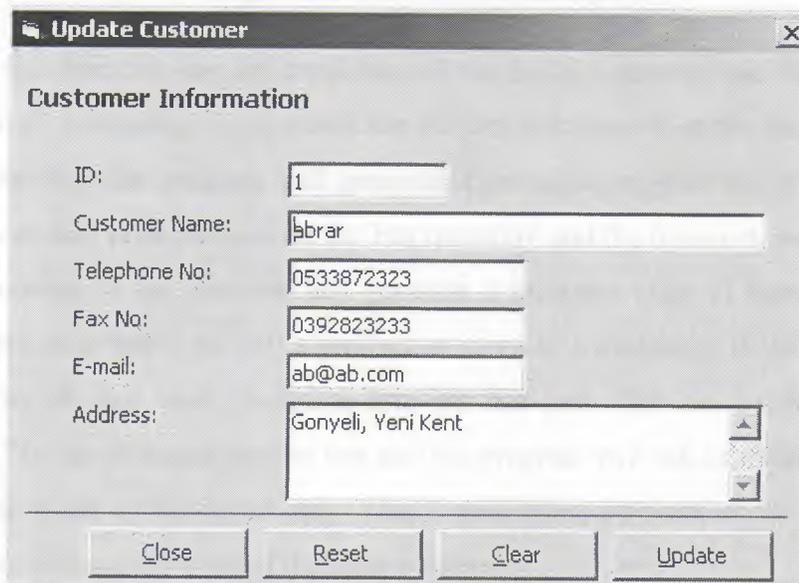

. This is a customer form which shows us the details of a customers who is willing to buy a product from the shop. Here we can add customers information.

The screenshot shows a dialog box titled "Edit Customer". It features a text input field for "Customer Name" containing the text "abrar". Below the input field, there are three buttons: "Delete", "Edit", and "Close".

Figure 19 Edit Customer

This form shows us all the customers in the database and gives us the ability to edit or delete them.

The screenshot shows a dialog box titled "Update Customer". It is labeled "Customer Information" and contains several input fields: "ID:" (1), "Customer Name:" (abrar), "Telephone No:" (0533872323), "Fax No:" (0392823233), "E-mail:" (ab@ab.com), and "Address:" (Gonyeli, Yeni Kent). At the bottom, there are four buttons: "Close", "Reset", "Clear", and "Update".

Figure 20 Update Customer

The screenshot shows a software interface for creating an invoice. The title bar reads "Sent Invoice". The form includes the following fields and controls:

- User Name:** Text input field containing "emrah".
- Customer Name:** Dropdown menu showing "New Customer".
- Date:** Text input field containing "04/06/2010".
- Product Name:** Dropdown menu.
- Price:** Text input field containing "0".
- Quantity:** Text input field containing "0".
- Discount:** Text input field containing "0%".
- Total Price:** Text input field containing "0".
- Control:** Two buttons labeled "Add" and "Clear".
- Invoice List:** A table with the following data:

Product Name:	Price:	Quantity:	Discount:	Total Price:
Charger	500.00	1	0%	500
Nokia 3310	30.00	2	0%	60
- Bottom Buttons:** "Delete Selected", "Delete All", "Cancel", and "Save & Print".

Figure 21 Sent Invoice Receipt

From this form we can add products and set the buy quantity and the discount, and then add them to a shopping list and save the invoice information in the database when we finish, and after that the program will generate a printable copy of the information. From this form we can add products and set the buy quantity and the discount, and then save the invoice information in the database and generate a printable copy of them. Note that this invoice is given only when we sell a product or more to a customer, if the customer is not defined and we do not want to define him we can just click on the list item "NEW CUSTOMER" in the customer combo box and the program will ask us to enter a temporary customer name to use in this report only. This is used when we want to sell a small amount of merchandise without the need of defining a customer.

Note too that the product prices are also automatically taken from the products table in the database.

Also the user name will be saved and printed with the receipt for security reasons, so if a customer wanted to revise the mobile shop companies we will know who did the sale and will know who had given a customer a big discount.

Received Invoice

User Name: Company Name: Date:

Product Name: Price: Quantity: Discount: Total Price:

Control:

Product Name:	Price:	Quantity:	Discount:	Total Price:
Nokia 5800 MusicXpress	500.00	1	0%	500
Sony Ericsson J210i	100.00	2	0%	200

Figure 22 Received Invoice Receipt

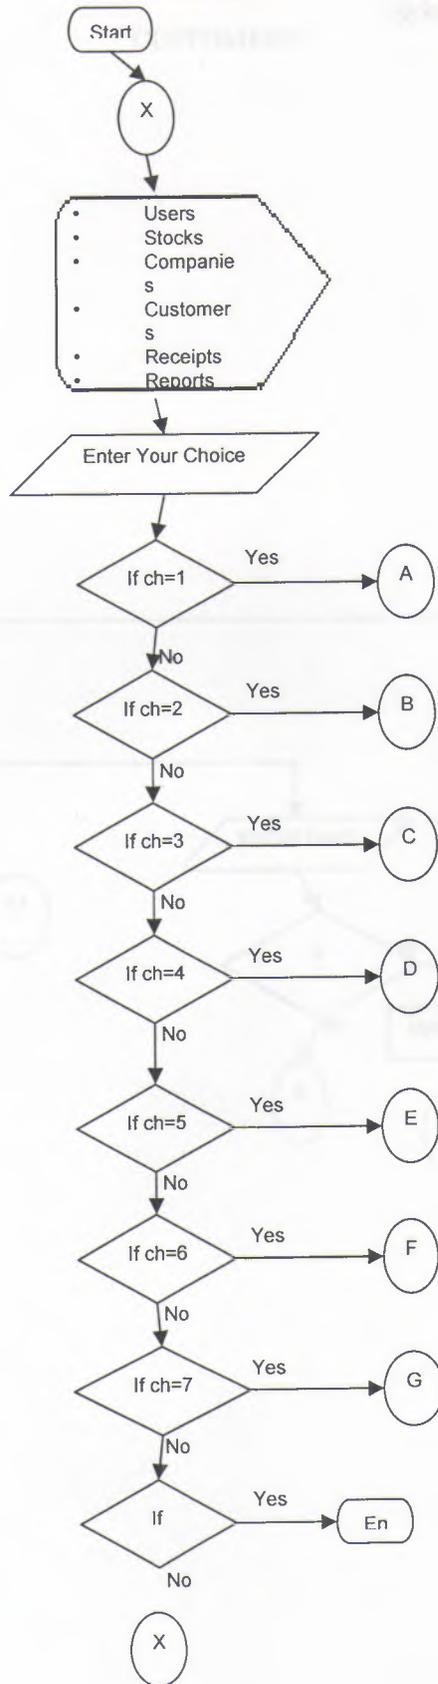

This invoice receipt is almost same as the sent invoice receipt but the only difference here is this receipt is given to the companies we buy merchandise from, and for that we do not select am customer name, we select a companies name.

The reports were made using Crystal Report which is a very unique program that reads the information from the database and shows it to us in a premade report.

CONCLUSION

Database management has evolved from a specialized computer application to a central component of a modern computing environment. As such, knowledge about database systems has become an essential part of an education in computer science. Our purpose in this project is to present the fundamental concepts of database management. These concepts include aspects of database design, and database-system implementation.

The software described in the project is prepared by Visual Basic 6.0 and Microsoft Access. Both of them are powerful tools to create and operate sophisticated data organizations.

Visual Basic 6.0 has many tools to help programmers. However, there are new editions of Visual Basic, the version 6.0 is preferred, to show that this version is also sufficient to make good software.

This project contains many examples of using database (SQL) queries like inserting, deleting and updating records in the database.
