## ACKNOWLEDGEMENTS

So thanks to my teachers; Dr.Mustafa Menekay, Dr. Nadire Çavuş and Ümit İlhan and especially thanks to my mom and dad about their contribute.

## ABSTRACT

I observed to many web sites, these web sites are using only html coding language. This coding don't allow to manage your web site by using web pages. Old system, I mean not internet programming, I think it is boring. Because we have to use file transfer protocol to update our web site. In new system (ASP, internet programming) is using ftp at once time then we are using interactive ASP language to update, delete, and our web pages. Here is, I'm going to talk about, How do we create asp web pages?

## INTRODUCTION

Simply you must have a standart desktop computer or laptop. Our computers must have above the 533 Mhz. CPU, above the 256 Mb. RAM and 100 Mb. Free disk space. This is the recomended hardware.

On the other side, you must have Windows' operating system like a Windows XP Professional. You must have the internet web browser to run your asp application like an internet explorer 7, Firefox or Opera 9. You have to install local host web server to execute your asp web coding. I'm advising to you, you can install IIS (internet information services) or Baby Web Server. This is the recomended software.

If we want to enter some data, we have to login by admin page. In admin page menaging datas, guests are watching your changing on guest area. We can find these questions' answers:

- How do we create any object under a known subjects?
- How do we edit any object?
- How do we delete any object?
- How do we find any created object?
- How do we edit a subject title?
- How do we insert a picture to any object?

## DESIGN OF THE SYSTEM

### Explanation:

I'm using admin panel when I want to producing outputs. Admin panel is protecting by password and user id. I'm opening the admin panel when I enter the password and user id correctly. And then all opportunities under my control. Admin panel is including useful options. Every happens are coming true by myself when I want it. Every changing is reflecting to guest space. Here is ASP is allowing to us these specifinc happens. I think, you have a question. What is the ASP ? I 'm answering :

**Active Server Pages (ASP)** is Microsoft's server-side script engine for dynamically-generated web pages. It is marketed as an add-on to Internet Information Services (IIS). Programming ASP websites is made easier by various built-in objects. Each object corresponds to a group of frequently-used functionality useful for creating dynamic web pages. In ASP 2.0 there are six such built-in objects: Application, ASPError, Request, Response, Server, and Session. Session, for example, is a cookie-based session object that maintains variables from page to page.

Most ASP pages are written in VBScript, but any other Active Scripting engine can be selected instead by using the @Language directive or the <script language="language" runat="server"> syntax. JScript (Microsoft's implementation of ECMAScript) is the other language that is usually available. PerlScript (a derivative of Perl) and others are available as third-party installable Active Scripting engines.

InstantASP and ChiliASP are technologies that run ASP without Windows Operating System. There are large open source communities on the WWW, such as ASPNuke, which produce ASP scripts, components and applications to be used for free under certain license terms.

## Database Design:

Database Name: **mg.mdb**

### Tables

dokuman			katolog		
Field Name	Data Type	Size	Field Name	Data Type	Size
d_id	Autonumber	Long Int.	k_id	Autonumber	Long Int.
d_baslik	Text	20	k_konu	Text	10
d_dokuman	Memo				
d_tarih	Date/time				
d_ekleyen	Text	10			
d_konu_id	Number	Long Int.			
d_resim	Text	20			

mesajlar			yonet		
Field Name	Data Type	Size	Field Name	Data Type	Size
m_id	Autonumber	Long Int.	yid	Autonumber	Long. Int.
