# Chapter 4 

## Alkanes

## NEPHAR 109 Organic Chemistry <br> Assist.Prof. Banu Keşanlı

## Summary of Important Families of Organic Compounds

|  | Family |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Alkane | Alkene | Alkyne | Aromatic | Haloalkane | Alcohol | Ether |
| Functional group | C-H <br> and <br> C-C <br> bonds |  | $-\mathrm{C} \equiv \mathrm{C}-$ | Aromatic ring |  |  |  |
| General formula | RH | $\begin{aligned} & \mathrm{RCH}=\mathrm{CH}_{2} \\ & \mathrm{RCH}=\mathrm{CHR} \\ & \mathrm{R}_{2} \mathrm{C}=\mathrm{CHR} \\ & \mathrm{R}_{2} \mathrm{C}=\mathrm{CR}_{2} \end{aligned}$ | $\begin{aligned} & \mathrm{RC} \equiv \mathrm{CH} \\ & \mathrm{RC} \equiv \mathrm{CR} \end{aligned}$ | ArH | RX | ROH | ROR |
| Specific example | $\mathrm{CH}_{3} \mathrm{CH}_{3}$ | $\mathrm{CH}_{2}=\mathrm{CH}_{2}$ | $\mathrm{HC} \equiv \mathrm{CH}$ |  | $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{Cl}$ | $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}$ | $\mathrm{CH}_{3} \mathrm{OCH}_{3}$ |
| IUPAC name | Ethane | Ethene | Ethyne | Benzene | Chloroethane | Ethanol | Methoxymethane |
| Common name ${ }^{\text {a }}$ | Ethane | Ethylene | Acetylene | Benzene | Ethyl chloride | Ethyl alcohol | Dimethyl ether |

## Summary (cont.) ..

| Family |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Amine | Aldehyde | Ketone | Carboxylic Acid | Ester | Amide | Nitrile |
|  |  |  |  |  |  | $-\mathrm{C} \equiv \mathrm{N}$ |
| $\begin{aligned} & \mathrm{RNH}_{2} \\ & \mathrm{R}_{2} \mathrm{NH} \\ & \mathrm{R}_{3} \mathrm{~N} \end{aligned}$ | $\begin{gathered} 0 \\ \\| \\ \mathrm{RCH} \end{gathered}$ | $\begin{gathered} 0 \\ \\| \\ R^{\prime} R^{\prime} \end{gathered}$ | $\begin{gathered} 0 \\ \\| \\ \mathrm{RCOH} \end{gathered}$ | $\begin{gathered} 0 \\ \text { RCOR' }^{\prime} \end{gathered}$ |    | RCN |
| $\mathrm{CH}_{3} \mathrm{NH}_{2}$ |  |  |  |  |  | $\mathrm{CH}_{3} \mathrm{C} \equiv \mathrm{N}$ |
| Methanamine | Ethanal | Propanone | Ethanoic acid | Methyl ethanoate | Ethanamide | Ethanenitrile |
| Methylamine | Acetaldehyde | Acetone | Acetic acid | Methyl acetate | Acetamide | Acetonitrile |

## General Structure of Alkanes, Alkenes and Alkynes

### 4.2. Shapes of Alkanes

$\rightarrow$ "Straight-chain" alkanes have a zig-zag orientation when they are in their most straight orientation - Often described as saturated hydrocarbons as contain only C and H and have C-C single

$\rightarrow$ Branched alkanes have at least one carbon which is attached to more than two other carbons

## Acidity Trends

$\rightarrow$ Acetylenic hydrogens have a pKa of about 25 and are much more acidic than most other C-H bonds

- The relative acidity of acetylenic hydrogens in solution is:

$$
\begin{array}{lccccc}
\mathrm{H}-\stackrel{\mathrm{O}}{\mathrm{O}}>\mathrm{H}-\stackrel{\ddot{\mathrm{O}}}{\mathrm{O}}>\mathrm{H}-\mathrm{C} \equiv \mathrm{CR}>\mathrm{H}-\mathrm{NH}_{2}>\mathrm{H}-\mathrm{CH}=\mathrm{CH}_{2}>\mathrm{H}-\mathrm{CH}_{2} \mathrm{CH}_{3} \\
\mathrm{p} K_{\mathrm{a}} & \mathbf{1 5 . 7} & \mathbf{1 6 - 1 7} & \mathbf{2 5} & \mathbf{3 8} & \mathbf{4 4} \\
\hline
\end{array}
$$

### 4.3. I UPAC Nomenclature of Alkanes

$\rightarrow$ Before the end of the 19th century compounds were named using nonsystematic nomenclature
$\rightarrow$ These "common" or "trivial" names were often based on the source of the compound or a physical property
$\rightarrow$ The International Union of Pure and Applied Chemistry (IUPAC) started devising a systematic approach to nomenclature in 1892
$\rightarrow$ The fundamental principle in devising the system was that each different compound should have a unique unambiguous name
$\rightarrow$ The basis for all IUPAC nomenclature is the set of rules used for naming alkanes

## Nomenclature of Unbranched Alkanes

| Name | Number of Carbon Atoms | Structure | Name | Number of Carbon Atoms | Structure |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Methane | 1 | $\mathrm{CH}_{4}$ | Heptadecane | 17 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{15} \mathrm{CH}_{3}$ |
| Ethane | 2 | $\mathrm{CH}_{3} \mathrm{CH}_{3}$ | Octadecane | 18 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{16} \mathrm{CH}_{3}$ |
| Propane | 3 | $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{3}$ | Nonadecane | 19 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{77} \mathrm{CH}_{3}$ |
| Butane | 4 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{3}$ | Eicosane | 20 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{18} \mathrm{CH}_{3}$ |
| Pentane | 5 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{3}$ | Heneicosane | 21 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{19} \mathrm{CH}_{3}$ |
| Hexane | 6 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{3}$ | Docosane | 22 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{20} \mathrm{CH}_{3}$ |
| Heptane | 7 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{5} \mathrm{CH}_{3}$ | Tricosane | 23 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{21} \mathrm{CH}_{3}$ |
| Octane | 8 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{6} \mathrm{CH}_{3}$ | Triacontane | 30 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{28} \mathrm{CH}_{3}$ |
| Nonane | 9 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{7} \mathrm{CH}_{3}$ | Hentriacontane | 31 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{29} \mathrm{CH}_{3}$ |
| Decane | 10 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{8} \mathrm{CH}_{3}$ | Tetracontane | 40 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{38} \mathrm{CH}_{3}$ |
| Undecane | 11 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{9} \mathrm{CH}_{3}$ | Pentacontane | 50 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{48} \mathrm{CH}_{3}$ |
| Dodecane | 12 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{10} \mathrm{CH}_{3}$ | Hexacontane | 60 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{58} \mathrm{CH}_{3}$ |
| Tridecane | 13 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{11} \mathrm{CH}_{3}$ | Heptacontane | 70 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{88} \mathrm{CH}_{3}$ |
| Tetradecane | 14 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{12} \mathrm{CH}_{3}$ | Octacontane | 80 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{78} \mathrm{CH}_{3}$ |
| Pentadecane | 15 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{13} \mathrm{CH}_{3}$ | Nonacontane | 90 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{88} \mathrm{CH}_{3}$ |
| Hexadecane | 16 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{3}$ | Hectane | 100 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{98} \mathrm{CH}_{3}$ |

### 4.3A Nomenclature of Unbranched

 Alkyl Groups$\rightarrow$ The unbranched alkyl groups are obtained by removing one hydrogen from the alkane and named by replacing the -ane of the corresponding alkane with -yl

| ALKANE |  | ALKYL GROUP | ABBREVIATION |
| :--- | :--- | :---: | :---: |
| $\mathrm{CH}_{3}-\mathrm{H}$ | becomes | $\mathrm{CH}_{3}-$ | Me- |
| Methane |  | Methyl |  |
| $\mathrm{CH}_{3} \mathrm{CH}_{2}-\mathrm{H}$ | becomes | $\mathrm{CH}_{3} \mathrm{CH}_{2}-$ | $\mathrm{Et}-$ |
| Ethane |  | Ethyl |  |
| $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2}-\mathrm{H}$ | becomes | $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2}-$ | $\mathrm{Pr}-$ |
| Propane |  | Propyl |  |
| $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}-\mathrm{H}$ <br> Butane | becomes | $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}-$ | $\mathrm{Bu}-$ |
| Butyl |  |  |  |

## I UPAC Nomenclature

## Prefix-Parent-Suffix

Where are the substituents?

What family?
(functional group)

How many carbons?
> If two or more identical substituents are present, use one of the multiplier prefixes di-, tri-, tetra-,.

Nomenclature of Branched-Chain Alkanes (I UPAC)
$\rightarrow$ Locate the longest continuous chain of carbons; this is the parent chain and determines the parent name
$\rightarrow$ Number the longest chain beginning with the end of the chain nearer the substituent
$\rightarrow$ Designate the location of the substituent

3-Methylheptane

Substituents

### 4.3C Nomenclature of Branched Alkyl Chains

$\rightarrow$ Two alkyl groups can be derived from propane

Three-Carbon Groups

1-Methylethyl or isopropyl group

## $\mathrm{CH}_{2}-\mathrm{CH}-\mathrm{CH}_{2}-\mathrm{CH}_{3}$

Secondary butyl group (sec-Bu)

Tertiary butyl group (tert-Bu)
$\rightarrow$ The neopentyl group is a common branched alkyl group

$$
\mathrm{CH}_{3}-\left.\right|_{\mathrm{C}} ^{\mathrm{C}} \mathrm{CH}_{3}^{\mathrm{CH}}-\mathrm{CH}_{2}-
$$

2,2-Dimethylpropyl or neopentyl group

## Cycloalkanes

Cycloalkanes are saturated compounds consisting of rings of $-\mathrm{CH}_{2}-$ units with a general formula of $\left(\mathrm{CH}_{2}\right)_{n}$

### 4.4. Nomenclature of Cycloalkanes

- The prefix cyclo- is added to the name of the alkane with the same number of carbons
$\rightarrow$ When one substituent is present it is assumed to be at position one and is not numbered
$\rightarrow$ When two alkyl substituents are present the one with alphabetical priority is given position 1
$\rightarrow$ Numbering continues to give the other substituent the lowest number
$\rightarrow$ Hydroxyl has higher priority than alkyl and is given position 1
$\rightarrow$ If a long chain is attached to a ring with fewer carbons, the cycloalkane is considered the substituent

Isopropylcyclohexane

1-Ethyl-3-methylcyclohexane (not 1-ethyl-5-methylcyclohexane)

4-Chloro-2-ethyl-1-methylcyclohexane (not 1-chloro-3-ethyl-4-methylcyclohexane)

Chlorocyclopentane

2-Methylcyclohexanol

1-Cyclobutylpentane

1,3-Dicyclohexylpropane

### 4.3D Classification of Hydrogen Atoms

$\rightarrow$ Hydrogens take their classification from the carbon they are attached to

4.3E Nomenclature of Alkyl Halides

- In IUPAC nomenclature halides are named as substituents on the parent chain
- Halo and alkyl substituents are considered to be of equal ranking

## - Common nomenclature of simple alkyl halides is accepted by IUPAC and still used

### 4.4B Bicyclic compounds

$\rightarrow$ Bicyloalkanes contain 2 fused or bridged rings
$\rightarrow$ The alkane with the same number of total carbons is used as the parent and the prefix bicyclo- is used

A bicycloheptane

## $\rightarrow$ The number of carbons in each bridge is included

 in the middle of the name in square brackets

8-Methylbicyclo[3.2.1]octane

8-Methylbicyclo[4.3.0]nonane

### 4.8. Sigma Bonds and Bond Rotation

$\rightarrow$ Ethane has relatively free rotation around the carbon-carbon bond
$\rightarrow$ The staggered conformation has C-H bonds on adjacent carbons as far apart from each other as possible

- The drawing to the right is called a Newman projection

## $\rightarrow$ The eclipsed conformation has all C-H bonds on adjacent carbons directly on top of each other

### 4.12 Conformations of Cyclohexane

$\rightarrow$ The chair conformation has no ring strain

- All bond angles are $109.5^{\circ}$ and all C-H bonds are perfectly staggered

### 4.13 Substituted Cyclohexanes: Axial and

 Equatorial Hydrogen Atoms$\rightarrow$ Axial hydrogens are perpendicular to the average plane of the ring
$\Rightarrow$ Equatorial hydrogens lie around the perimeter of the ring

> The C-C bonds and equatorial C-H bonds are all drawn in sets of parallel lines
-The axial hydrogens are drawn straight up and down

## $\rightarrow$ Methyl cyclohexane is more stable with the methyl equatorial as the axial methyl has an unfavorable 1,3-diaxial interaction with axial C-H bonds 2 carbons away

(less stable)

(a)
(b)

(2)
(more stable by $7.6 \mathrm{~kJ} \mathrm{~mol}^{-1}$ )

### 4.14 Disubstitued Cycloalkanes

## ->Can exist as pairs of cis-trans stereoisomers Cis: groups on same side of ring Trans: groups on opposite side of ring

trans-1,4-Dimethylcyclohexane

### 4.18 Synthesis of Alkanes

## - Hydrogenation of Alkenes and Alkynes

## General Reaction

Alkane

Alkene

Alkyne

Alkane

2-Methylpropene
Isobutane

### 4.18A Reduction of Alkyl Halides

or*

$$
\begin{gathered}
\mathrm{R}-\mathbf{X}+\mathrm{Zn}+\mathbf{H X} \longrightarrow \mathrm{R}-\mathrm{H}+\mathrm{ZnX}_{2} \\
\mathrm{R}-\mathbf{X} \xrightarrow[\left(-\mathrm{ZnX} \mathrm{X}_{2}\right)]{\mathrm{Zn}, \mathrm{XX}} \mathrm{R}-\mathrm{H}
\end{gathered}
$$

sec-Butyl bromide

Butane (2-bromobutane)

### 4.18C Alkylation of Terminal Alkynes

## $\rightarrow$ Alkynes can be subsequently hydrogenated to alkanes

## Reactivity of Alkanes

> Alkanes have strong C-C, C-H bonds > Show slight affinity for chemical reactions

Combustion Reaction

## $\mathrm{CH}_{4}+2 \mathrm{O}_{2} \longrightarrow 2 \mathrm{CO}_{2}+2 \mathrm{H}_{2} \mathrm{O}+890 \mathrm{~kJ} / \mathrm{mol}$

Halogenation under UV light

$$
\mathrm{CH}_{4}+\mathrm{Cl}_{2} \xrightarrow{h v} \mathrm{CCl}_{4}+\mathrm{HCl}
$$
