Architectural Structures: Form, Behavior, and Design

Arch 331 hüdaverdi tozan **S**pring 2013

lecture **ONE**

structural behavior and design

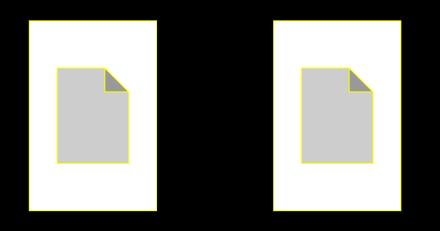

www.greatbuildings.com

Introduction 1 Lecture 1

Syllabus & Student Understandings

Course Description

statics

- physics of forces and reactions on bodies and systems
- equilibrium (bodies at rest)
- structures

 something made up of interdependent parts in a definite pattern of organization

• design

 assessing and meeting structural requirements of parts and the whole

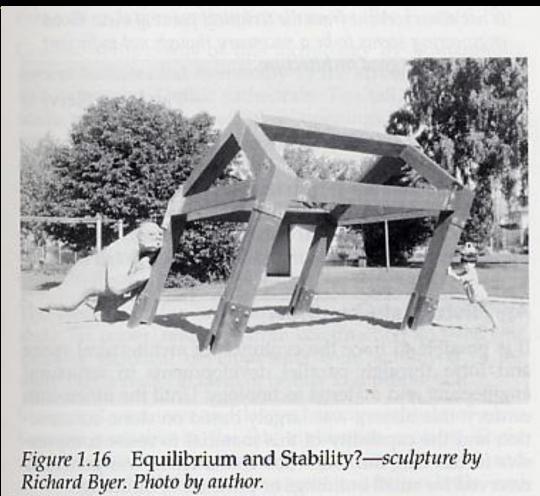

Introduction 3 Lecture 1 Arc<mark>hitectural Structures</mark> ARCH 331

Course Description

- mechanics of materials
 - external loads and effect on deformable bodies
 - use it to answer question if structure meets requirements of
 - stability and equilibrium
 - strength and stiffness
 - other principle building requirements
 - economy, functionality and aesthetics

Structure Requirements

stability & equilibrium
 STATICS

Structure Requirements (cont)

 strength & stiffness

 concerned with stability of components

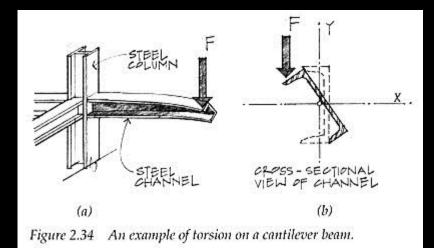

Figure 1.15 Stability and the strength of a structure—the collapse of a portion of the UW Husky stadium during construction (1987) due to a lack of adequate bracing to ensure stability. Photo by author.

Structural System Selection

- kind & size of loads
- building function
- soil & topology of site
- systems integration
- fire rating
- construction (\$\$, schedule)
- architectural form

Knowledge Required

- external forces
- internal forces
- material properties
- member cross sections

- ability of a material to resist breaking
- structural elements that resist excessive – deflection
 - deformation

Problem Solving

1. STATICS:

equilibrium of external forces, internal forces, <u>stresses</u>

2. GEOMETRY:

cross section properties, deformations and conditions of geometric fit, <u>strains</u>

3. MATERIAL PROPERTIES:

<u>stress-strain relationship</u> for each material obtained from testing

Relation to Architecture

"The geometry and arrangement of the load-bearing members, the use of materials, and the crafting of joints all represent opportunities for buildings to express themselves. The best buildings are not designed by architects who after resolving the formal and spatial issues, simply ask the structural engineer to make sure it doesn't fall down." - Onouye & Kane Statics and Strength of Materials for

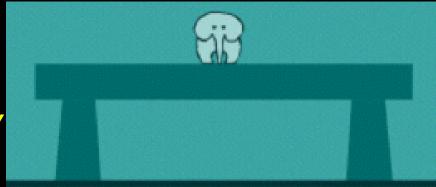

Architecture and Building Construction

Architectural Space and Form

- evolution traced to developments in structural engineering and material technology
 - stone & masonry
 - timber
 - concrete
 - cast iron, steel
 - tensile fabrics, pneumatic structures.....

Architectural Space and Form

- structure is a device for channeling loads that result from the use and/or presence of the building to the ground
 - span a roof
 - hold up a floor
 - cross a river
 - suspend a canopy

www.pbs.org/wgbh/buildingbig/

Stone + Masonry

- columns
- walls
- lintels
- beams
- arches
- footings

Architectural Structures ARCH 331 S2013abn

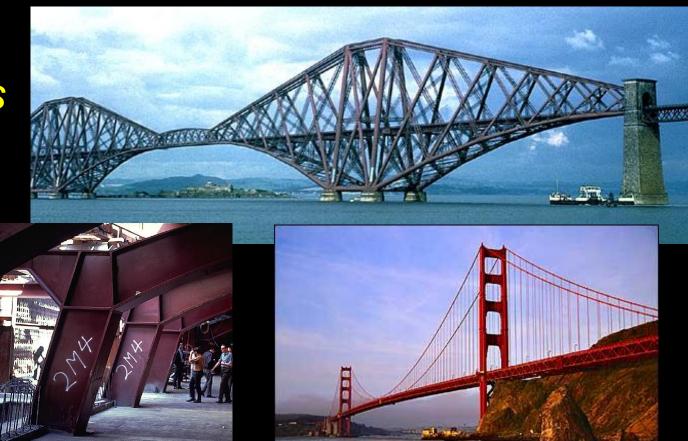

Wood

- columns
- beams
- trusses

Steel

- cast iron wrought iron steel
- cables
- columns
- beams
- trusses
- frames

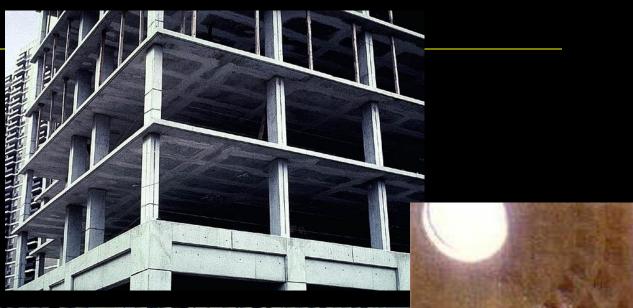

http:// nisee.berkeley.edu/godden Architectural Structures ARCH 331

Introduction 15 Lecture 1 S2013abn

Concrete

- columns
- beams
- slabs
- domes
- footings

Introduction 16 Lecture 1 Architectural Structures http://nisee.berkeley.edu/godden ARCH 331 S2013abn

- axial tension
 bending
- axial compression

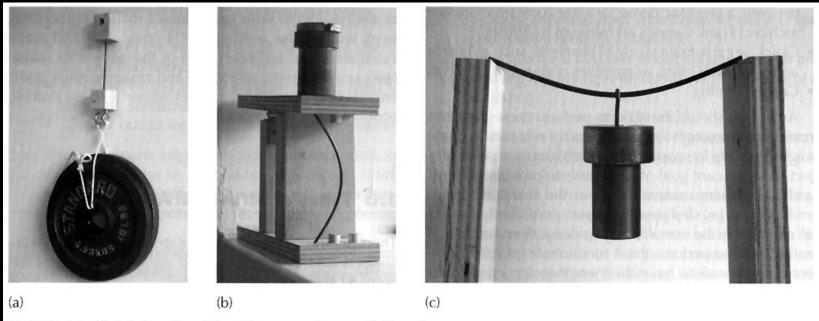

Figure 1.2 (a) Axial tension, (b) axial compression, and (c) bending.

member breadth & depth

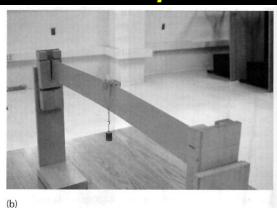

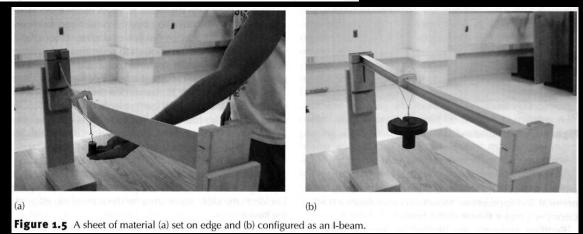

Figure 1.4 (a) A very shallow beam and (b) a deep beam.

Introduction 18 Lecture 1

stabilization

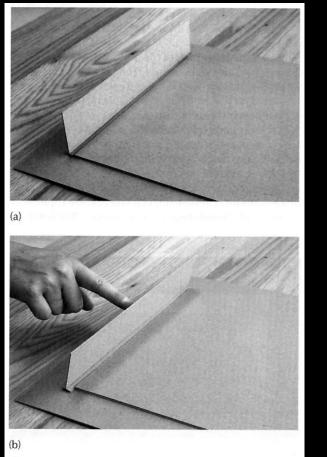

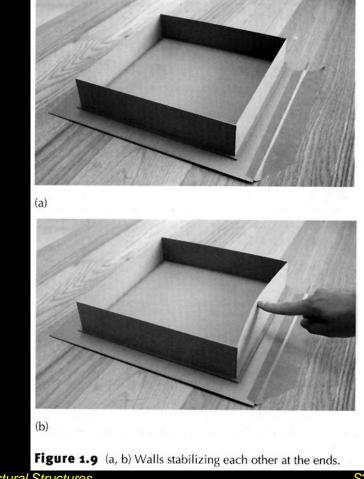

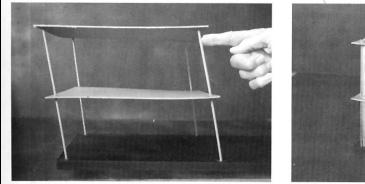

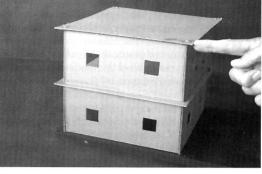

Figure 1.8 (a) A thin wall (b) subjected to lateral force.

• shear & bracing

(b)

Figure 1.29 (a, b) Structural frame stabilized by adding shear panels.

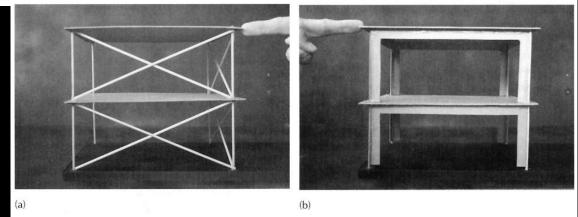

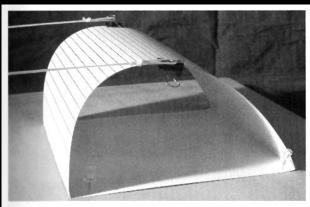

Figure 1.30 Bracing with (a) triangulation and (b) a rigid frame.

(a)

lateral resistance

(a)

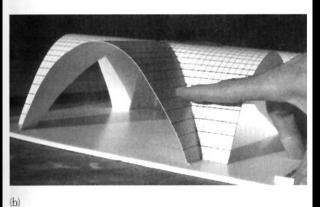

Figure 1.32 (a) A thin-shelled barrel vault and (b) a thin-shelled cross vault.

S2013abn

• twisting

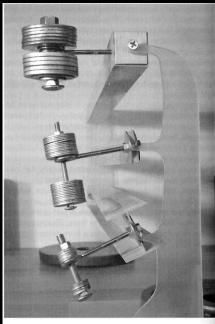

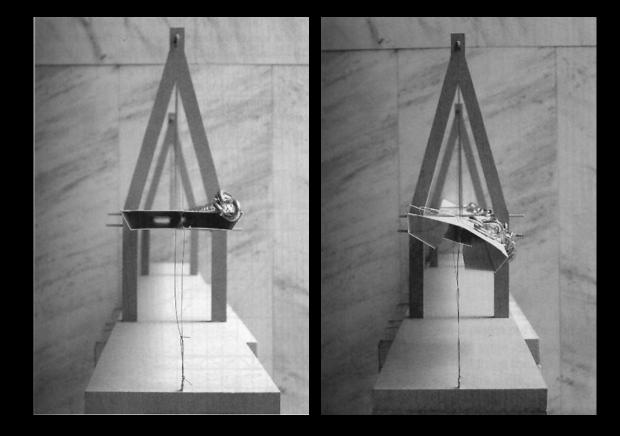

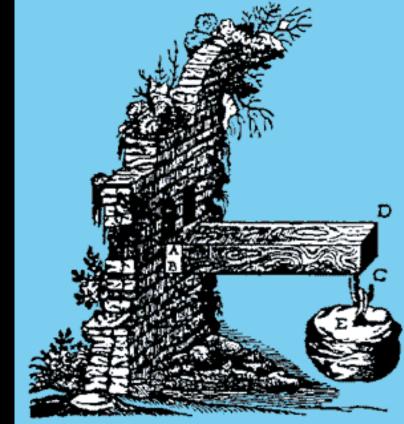

Figure 1.35 Torsion in a tube, a slab, and an I-section.

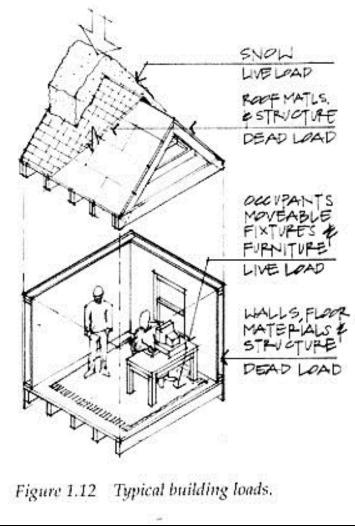

Structural Design

- planning
- preliminary structural configuration
- determination of loads
- preliminary member selection
- analysis
- evaluation
- design revision
- final design

- STATIC and DYNAMIC
- dead load
 - static, fixed, includes
 building weight, fixed
 equipment
- live load
 - transient and moving loads (including occupants), snowfall

Architectural Structures ARCH 331

S2013abn

wind loads

dynamic, wind pressures treated as lateral static loads on walls, up or down loads on

roofs

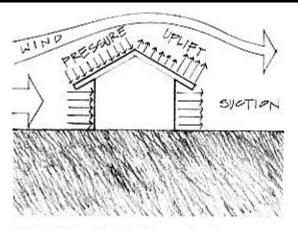

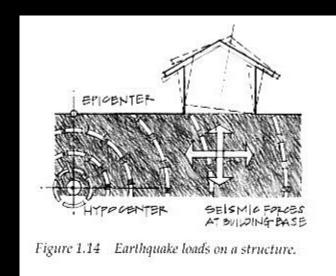

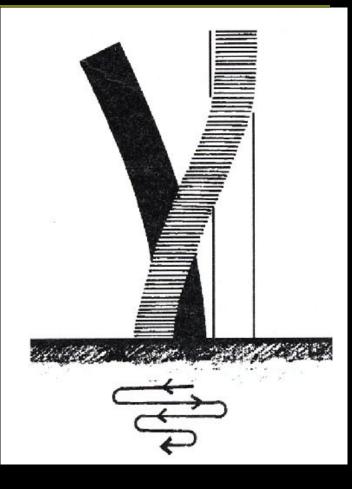

Figure 1.13 Wind loads on a structure.

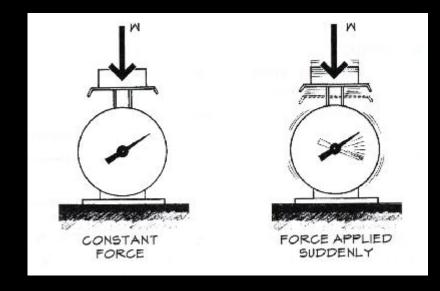

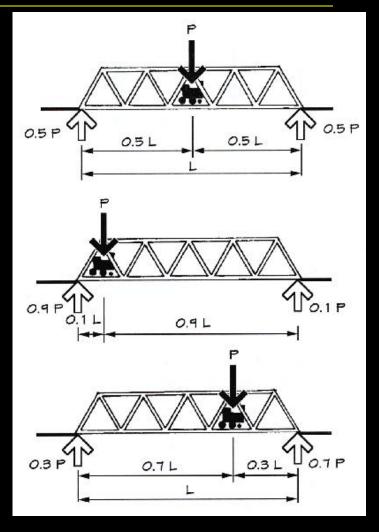

earthquake loads
 seismic, movement of ground ↓ ↔

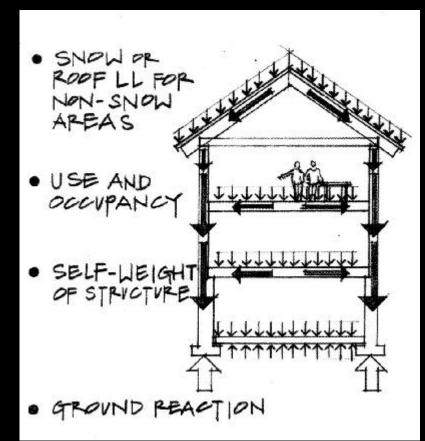

impact loads
 rapid, energy loads

- gravity acts on mass (F=m*g)
- force of mass
 - acts at a point
 - ie. joist on beam
 - acts along a "line"
 - *ie. floor on a beam*
 - acts over an area
 - *ie. people, books, snow on roof or floor*

Structural Math

- quantify environmental loads
 how big is it?
- evaluate geometry and angles
 - where is it?
 - what is the scale?
 - what is the size in a particular direction?
- quantify what happens in the structure

 how big are the internal forces?
 how big should the beam be?

Structural Math

- physics takes observable phenomena and relates the measurement with rules: <u>mathematical relationships</u>
- need
 - reference frame
 - measure of length, mass, time, direction, velocity, acceleration, work, heat, electricity, light
 - calculations & geometry
