beams: bending and shear stress

Beam Bending

- Galileo
 - relationship between stress and depth²
- can see
 - top squishing
 - bottom stretching

- what are the stress across the section?

Pure Bending

- *bending only*
- *no shear*
- *axial normal stresses from bending can be found in*
 - *homogeneous materials*
 - *plane of symmetry*
 - *follow Hooke's law*

Bending Moments

- *sign convention:*

- *size of maximum internal moment will govern our design of the section*

Normal Stresses

- *geometric fit*
 - *plane sections remain plane*
 - *stress varies linearly*

Figure 8.5(b) Beam bending under load.

Figure 8.5(a) Beam elevation before loading.

Beam cross section.

Neutral Axis

- stresses vary linearly
- zero stress occurs at the centroid
- neutral axis is line of centroids (n.a.)

Derivation of Stress from Strain

- *pure bending = arc shape*

$$L = R\theta$$

$$L_{outside} = (R + y)\theta$$

$$\epsilon = \frac{\delta}{L} = \frac{L_{outside} - L}{L} = \frac{(R + y)\theta - R\theta}{R\theta} = \frac{y}{R}$$

Derivation of Stress

- zero stress at n.a.

$$f = E\varepsilon = \frac{Ey}{R}$$

$$f_{\max} = \frac{Ec}{R}$$

$$f = \frac{y}{c} f_{\max}$$

Bending Moment

- *resultant moment from stresses = bending moment!*

$$M = \Sigma f y \Delta A$$

Figure 8.8 Bending stresses on section b-b.

$$= \Sigma \frac{y f_{max}}{c} y \Delta A = \frac{f_{max}}{c} \underline{\Sigma y^2 \Delta A} = \frac{f_{max}}{c} I = f_{max} S$$

Bending Stress Relations

$$\frac{1}{R} = \frac{M}{EI}$$

curvature

$$f_b = \frac{My}{I}$$

general bending stress

$$S = \frac{I}{c}$$

section modulus

$$f_b = \frac{M}{S}$$

maximum bending stress

$$S_{required} \geq \frac{M}{F_b}$$

required section modulus for design

Transverse Loading and Shear

- *perpendicular loading*
- *internal shear*
- *along with bending moment*

Bending vs. Shear in Design

- *bending stresses dominate*
- *shear stresses exist horizontally with shear*
- *no shear stresses with pure bending*

Shear Stresses

- *horizontal & vertical*

Shear Stresses

- *horizontal & vertical*

Beam Stresses

- *horizontal with bending*

Equilibrium

- horizontal force V needed

$$V_{longitudinal} = \frac{V_T Q}{I} \Delta x$$

- Q is a moment area

Moment of Area

- Q is a moment area with respect to the n.a. of area above or below the horizontal

- Q_{max} at $y=0$
(neutral axis)

- q is shear flow:

$$q = \frac{V_{longitudinal}}{\Delta x} = \frac{V_T Q}{I}$$

Shearing Stresses

$$f_v = \frac{V}{\Delta A} = \frac{V}{b \cdot \Delta x}$$

$$f_{v-ave} = \frac{VQ}{Ib}$$

- $f_{v-ave} = 0$ on the top/bottom
- b min may not be with Q max
- with $h/4 \geq b$, $f_{v-max} \leq 1.008 f_{v-ave}$

Rectangular Sections

$$I = \frac{bh^3}{12} \quad Q = A\bar{y} = bh^2/8$$

$$f_v = \frac{VQ}{Ib} = \frac{3V}{2A}$$

- f_{v-max} occurs at n.a.

Steel Beam Webs

- *W and S sections*
 - *b varies*

- *stress in flange negligible*
- *presume constant stress in web*

$$f_{v-max} = \frac{3V}{2A} \approx \frac{V}{A_{web}}$$

Shear Flow

- loads applied in plane of symmetry
- cut made perpendicular

$$q = \frac{VQ}{I}$$

Shear Flow Quantity

- sketch from Q

$$q = \frac{VQ}{I}$$

Connectors Resisting Shear

- plates with
 - nails
 - rivets
 - bolts
- splices

$$\frac{V_{longitudinal}}{p} = \frac{VQ}{I}$$

$$nF_{connector} \geq \frac{VQ_{connected\ area}}{I} \cdot p$$

Vertical Connectors

- isolate an area with vertical interfaces

$$nF_{connector} \geq \frac{VQ_{connected\ area}}{I} \cdot p$$

Unsymmetrical Shear or Section

- member can bend and twist
 - not symmetric
 - shear not in that plane
- shear center
 - moments balance
