#### ARCHITECTURAL STRUCTURES:

FORM, BEHAVIOR, AND DESIGN

ARCH 331 HÜDAVERDİ TOZAN SPRING 2013

ilecture fifteen

wood construction: materials & beams

NEAR EAST

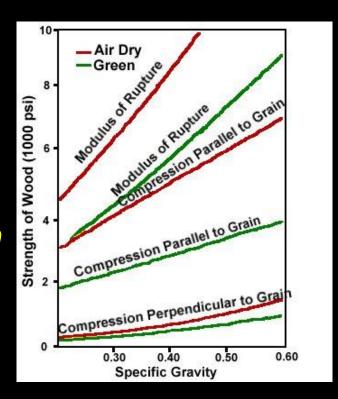

# Wood Beam Design

- National Design Specification
  - National Forest Products Association
- AND/LIPO NO. CONT. 
- ASD & LRFD (combined in 2005)
- adjustment factors x tabulated stress = allowable stress
- adjustment factors terms, C with subscript
- i.e, bending:

$$f_b \leq F_b' = F_b \times (product\ of\ adjustment\ factors)$$

#### Timber

- lightweight : strength ~ like steel
- strengths vary
  - by wood type
  - by direction
  - by "flaws"
- size varies by tree growth
- renewable resource
- manufactured wood
  - assembles pieces
  - adhesives

# Wood Properties

cell structure and density

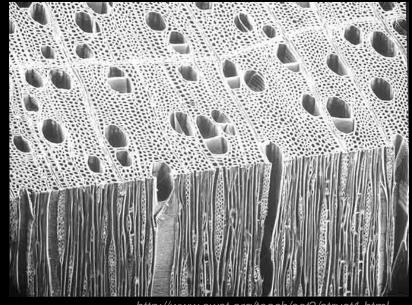

http://www.swst.org/teach/set2/struct1.html

softwood

# Wood Properties

- moisture
  - exchanges with air easily
  - excessive drying causes warping and shrinkage
  - strength varies some
- temperature
  - steam
  - volatile products
  - combustion

http://www.swst.org/teach/set2/struct1.htm

# Wood Properties

- load duration
  - short duration
    - higher loads
  - normal duration
    - > 10 years

- creep
  - additional
     deformation with no additional load

#### Structural Lumber

- dimension 2 x's (nominal)
- beams, posts, timber, planks
- grading
  - select structural
  - no. 1, 2, & 3
- tabular values by species
- glu-lam
- plywood

	Size classification	Design values in pounds per square inch					
Species and commercial grade		Extreme fiber in bending "Fb"		Tension parallel	Horizontal	Compression perpendicular	(
		Single- member uses	Repetitive- member uses	to grain	shear "F <sub>v</sub> "	to grain	
SOUTHERN PINE (Surfaced di	y. Used at 19% m	ax. m.c.)

## Adjustment Factors

- terms
  - $-C_D = load duration factor$
  - $-C_{M}$  = wet service factor
    - 1.0 dry ≤ 16% MC
  - $-C_F = size factor$ 
    - visually graded sawn lumber and round timber > 12" depth

$$C_F = (12/d)^{\frac{1}{9}} \le 1.0$$

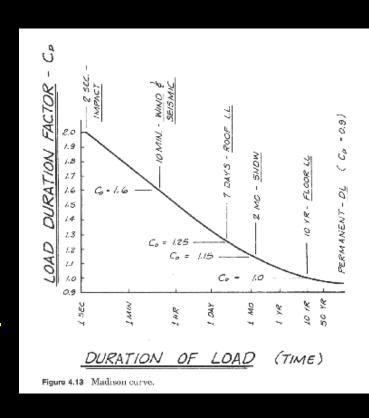

Table 10.3 (pg 376)

#### Adjustment Factors

- terms
  - $-C_{fij} = flat use factor$ 
    - not decking
  - $-C_i = incising factor$ 
    - increase depth for pressure treatment
  - $-C_t = temperature factor$ 
    - lose strength at high temperatures

#### Adjustment Factors

- terms
  - $-C_r$  = repetitive member factor
  - $-C_H = shear stress factor$ 
    - splitting
  - $-C_V = volume\ factor$ 
    - same as C<sub>F</sub> for glue laminated timber
  - $-C_L = beam stability factor$ 
    - beams without full lateral support
  - $-C_{C}$  = curvature factor for laminated arches

#### Allowable Stresses

- design values
  - F<sub>b</sub>: bending stress
  - F<sub>t</sub>: tensile stress | strong
  - − F<sub>v</sub>: horizontal shear stress
  - F<sub>c</sub>: compression stress (perpendicular to grain)
  - F<sub>c</sub>: compression stress (parallel to grain) strong
  - E: modulus of elasticity
  - $-F_p$ : bearing stress (parallel to grain)

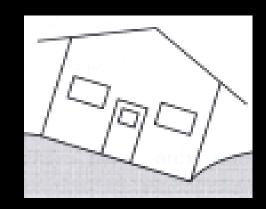

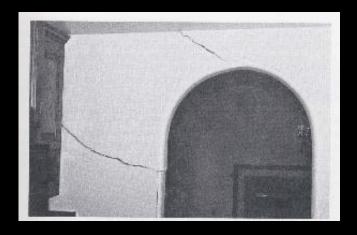

#### Load Combinations

- design loads, take the bigger of
  - (dead loads)/0.9
  - (dead loads + any possible combination of live loads)/C<sub>D</sub>
- deflection limits
  - <u>no load factors</u>
  - for stiffer members:
    - $\Delta_T$  max from LL + 0.5(DL)

# Beam Design Criteria

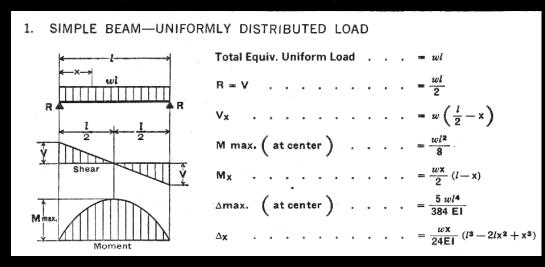

- strength design
  - bending stresses predominate
  - shear stresses occur
- serviceability
  - limit deflection and cracking
  - control noise & vibration
  - no excessive settlement of foundations
  - durability
  - appearance
  - component damage
  - ponding

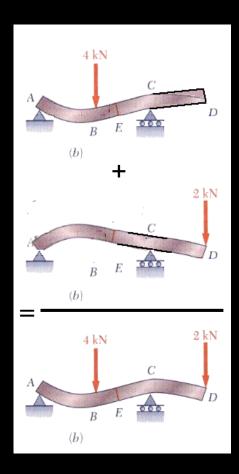

#### Beam Design Criteria

- superpositioning
  - use of beam charts
  - elastic range only!
  - "add" moment diagrams
  - "add" deflection CURVES (not maximums)

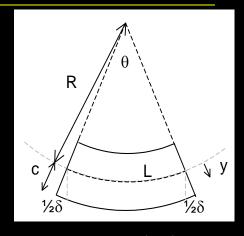

#### Beam Deformations

- curvature relates to
  - bending moment
  - modulus of elasticity
  - moment of inertia

$$\frac{1}{R} = \frac{M}{EI}$$

$$curvature = \frac{M(x)}{EI}$$

$$\theta = slope = \int \frac{M(x)}{EI} dx$$

$$\Delta = deflection = \int \int \frac{M(x)}{EI} dx$$

#### **Deflection Limits**

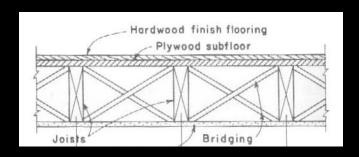

#### based on service condition, severity

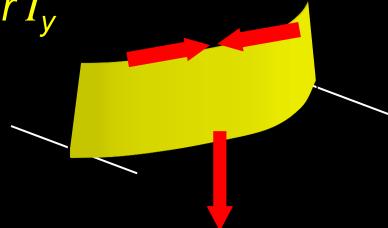

Use	LL only	DL+LL
Roof beams:		
Industrial	L/180	L/120
Commercial		
plaster ceiling	L/240	L/180
no plaster	L/360	L/240
Floor beams:		
Ordinary Usage	L/360	L/240
Roof or floor (damageable elements)		L/480

# Lateral Buckling

- lateral buckling caused by compressive forces at top coupled with insufficient rigidity
- can occur at low stress levels

• stiffen, brace or bigger  $I_y$ 

# Timber Beam

# **Bracing**

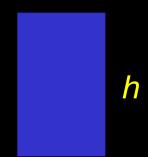

Table 9.3 Lateral bracing requirements for timber beams.

Beam Depth/ Width Ratio	Type of Lateral Bracing Required	Example
2 to 1	None	
3 to 1	The ends of the beam should be held in position	End blocking Joist or beam
5 to 1	Hold the compression edge in line (continuously)	Sheathing or decking  Joist or rafter
6 to 1	Diagonal bracing should be used	Nailed sheathing/decking  Bridging Joist
7 to 1	Both edges of the beam should be held in line	Nailed sheathing/decking, top and bottom  Bridging  Joist

#### Design Procedure

1. Know  $F_{all}$  for the material or  $F_{ll}$  for LRFD

2. Draw V & M, finding M<sub>max</sub>

3. Calculate  $S_{req'd}$   $(f_b \leq F_b)$ 

b

4. Determine section size

$$S=\frac{bh^2}{6}$$

- 4\*. Include self weight for M<sub>max</sub>
  - and repeat 3 & 4 if necessary

5. Consider lateral stability

Unbraced roof trusses were blown down in 1999 at this project in Moscow, Idaho.

Photo: Ken Carper

#### 6. Evaluate shear stresses - horizontal

• 
$$(f_v \leq F_v)$$

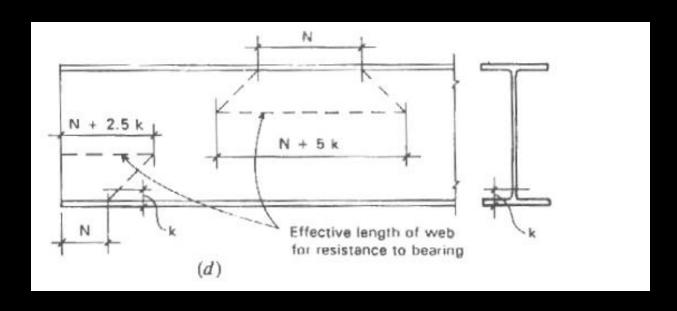

• rectangles and W's  $f_{v-\max} = \frac{3v}{2A} \approx \frac{v}{A_{web}}$ 

general

$$f_{v-\text{max}} = \frac{VQ}{Ib}$$

# 7. Provide adequate bearing area at supports

$$f_p = \frac{P}{A} \le F_p$$

#### 8. Evaluate torsion

$$(f_v \leq F_v)$$

circular cross section

$$f_v = \frac{T\rho}{J}$$

rectangular

$$f_{v} = \frac{T}{c_1 a b^2}$$

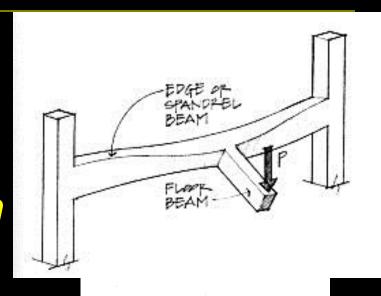

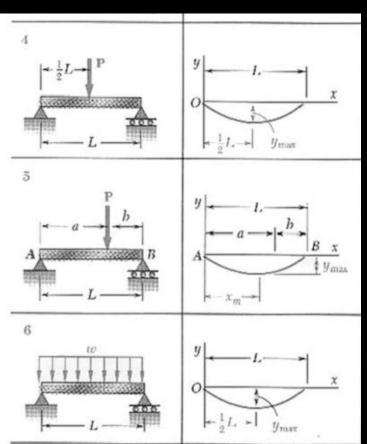

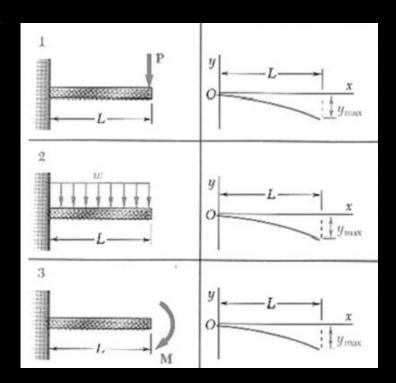

TABLE 3.1. Coefficients for Rectangular Bars in Torsion

a/b	<b>c</b> <sub>1</sub>	C <sub>2</sub>
1.0	° 0.208	0.1406
1.2	0.219	0.1661
1.5	0.231	0.1958
2.0	0.246	0.229
2.5	0.258	0.249
3.0	0.267	0.263
4.0	0.282	0.281
5.0	0.291	0.291
10.0	0.312	0.312
$\infty$	0.333	0.333

#### 9. Evaluate deflections

$$y_{\text{max}}(x) = \Delta_{actual} \le \Delta_{allowable}$$

#### Decking

- across beams or joists
- floors: 16 in. span common
  - ¾ in. tongue-in-groove plywood
  - 5/8 in. particle board over ½ in. plywood
  - hardwood surfacing
- roofs: 24 in. span common
  - ½ in. plywood

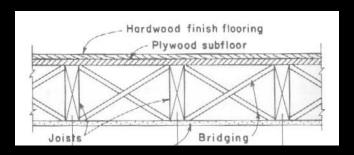

#### Joists & Rafters

- allowable load tables (w)
- allowable length tables for common

live & dead loads

- lateral bracing needed
- common spacings

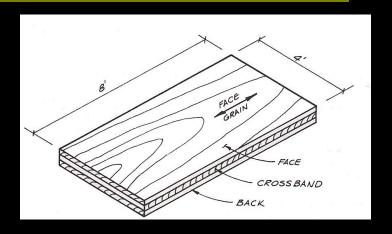

**DESIGN CRITERIA:** Deflection — For 40 psf (1.92 kN/m²) live load Limited to span in inches (mm) divided by 360 Strength — Live load of 40 psf (1.92 kN/m²) plus dead load of 10 psf (0.48 kN/m²) determines the Modulus of Elasticity, E, in 1,000,000 psi Size × 0.00689 for N/mm × 25.4 for mm 1.4 1.5 10-0 12.0 10-3 10-6 16.0 9-1 9-0 19.2 8-7 8-9 24.0 7-11 8-2 8-4 12.0 13-6 13-10 12-3 12-7 16.0 12-0 19.2 11 - 311-7 11-10 10-6 10-9 11-0 16-10 17-3 17-8 12.0 15-3 15-8 16-016.0 19.2 14-5 14-9 15 - 124.0 13-4 13-8 14-0 12.0 20-6 21-0 21-6 16.0 18-7 19-1 19-6 17-6 17-11 18-4 19.2 16-3 16-8 17-0 24.0 12.0 993 1,043 1,092 1,202 16.0 1,148 1,161 1,220 1,277 19.2 1,251 1,314

TABLE 5.5 Allowable Spans in Feet and Inches for Floor Joists

# Engineered Wood

- plywood
  - veneers at different orientations
  - glued together
  - split resistant
  - higher and uniform strength
  - limited shrinkage and swelling
  - used for sheathing, decking, shear walls, diaphragms

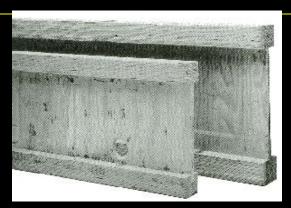

# Engineered Wood

- glued-laminated timber
  - glulam
  - short pieces glued together
  - straight or curved
  - grain direction parallel
  - higher strength
  - more expensive than sawn timber
  - large members (up to 100 feet!)
  - flexible forms

# Engineered Wood

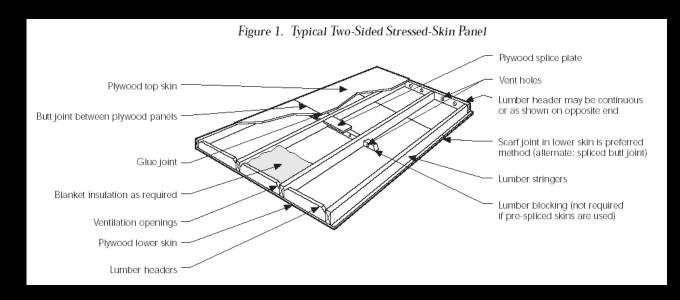

- I sections
  - beams
- other products
  - pressed veneer strip panels (Parallam)
  - laminated veneer lumber (LVL)
- wood fibers
  - Hardieboard: cement & wood

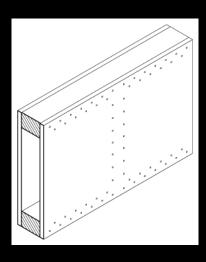

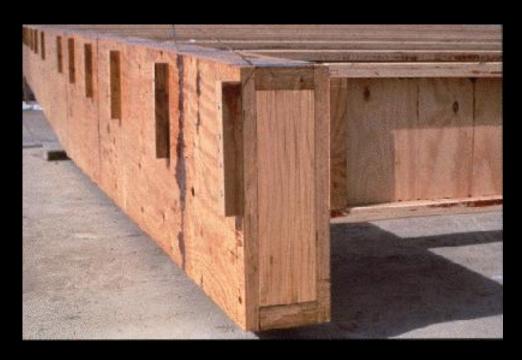

- stressed-skin elements
  - modular built-up "plates"
  - typically used for floors or roofs

- built-up box sections
  - built-up beams
  - usually site-fabricated
  - bigger spans

Architectural Structures
ARCH 331

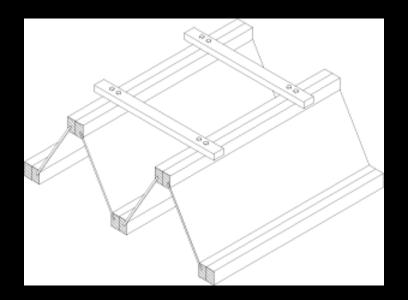

- trusses
  - long spans
  - versatile

– common in roofs

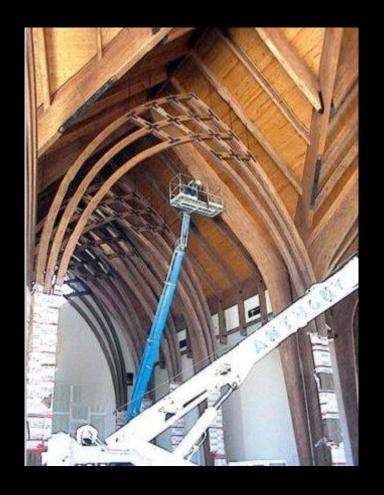

- folded plates and arch panels
  - usually of plywood

- arches and lamellas
  - arches commonly laminated timber
  - long spans
  - usually only for roofs

# Approximate Depths
