#### ARCHITECTURAL STRUCTURES:

FORM, BEHAVIOR, AND DESIGN

### Foundation

 the engineered interface between the earth and the structure it supports that transmits the loads to the soil or rock

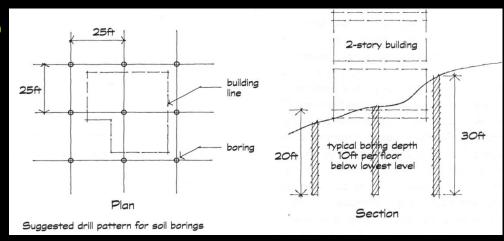

# Structural vs. Foundation Design

- structural design
  - choice of materials
  - choice of framing system
  - uniform materials and quality assurance
  - design largely independent of geology, climate, etc.

# Structural vs. Foundation Design

- foundation design
  - cannot specify site materials
  - site is usually predetermined
  - framing/structure predetermined
  - site geology influences foundation choice
  - no site the same
  - no designthe same

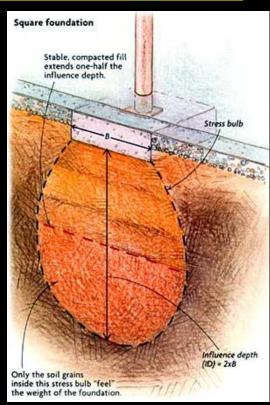

## Soil Properties & Mechanics

- unit weight of soil
- allowable soil pressure
- factored net soil pressure
- shear resistance
- backfill pressure
- cohesion & friction of soil
- effect of water
- settlement
- rock fracture behavior

## Soil Properties & Mechanics

- compressibility
  - settlements
- strength
  - stability
    - shallow foundations
    - deep foundations
    - slopes and walls
  - ultimate bearing capacity,  $q_u$
  - allowable bearing capacity,  $q_a =$

finehomebuilding.com

# Soil Properties & Mechanics

# • strength, qa

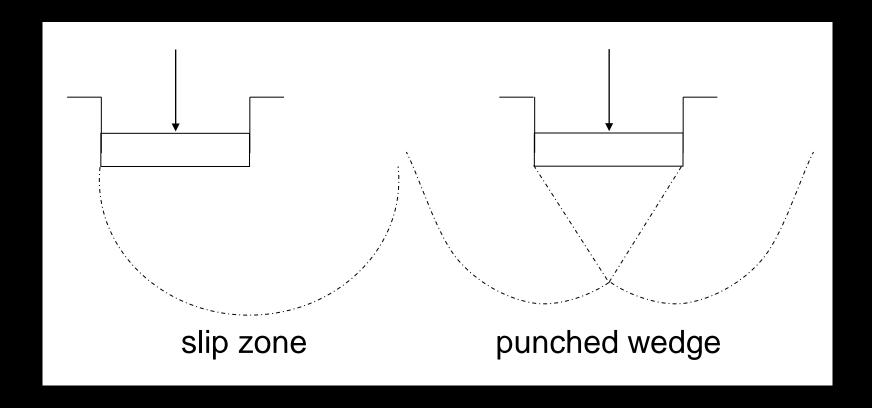

Class of material	Loadbearing pressure (pounds per square foot) <sup>a</sup>
1. Crystalline bedrock	12,000
2. Sedimentary rock	6,000
3. Sandy Gravel	5,000
4. Sand, silty sand, clayey sand, silty	
gravel and clayey gravel	3,000
5. Clay, sandy clay, silty clay & clayey silt	2,000

FIGURE 2.5

Presumptive surface bearing values of various soils, as given in the BOCA National Building Code/1996. (Reproduced by permission)

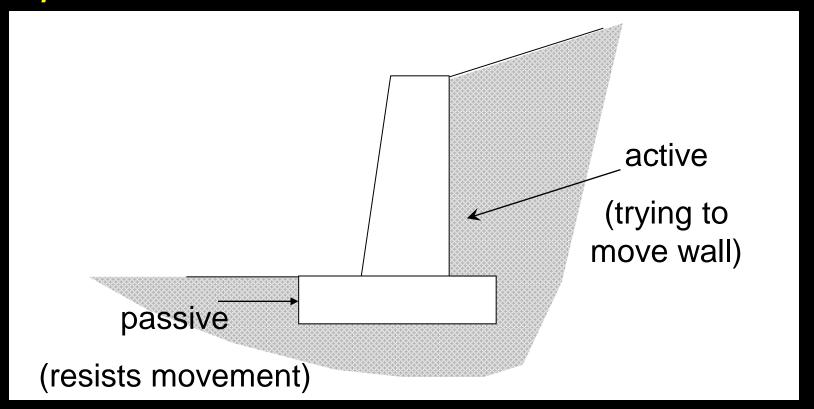

# Bearing Failure

## shear

## Lateral Earth Pressure

passive vs. active

### Foundation Materials

- concrete, plain or reinforced
  - shear
  - bearing capacity
  - bending
  - embedment length, development length
- other materials (piles)
  - steel
  - wood
  - composite

## Basic Foundation Requirements

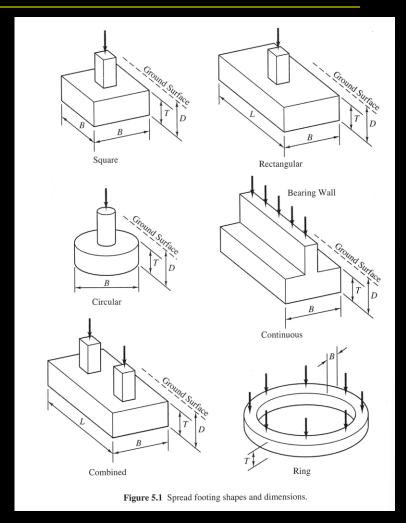

- safe against instability or collapse
- no excessive/damaging settlements
- consider environment
  - frost action
  - shrinkage/swelling
  - adjacent structure, property lines
  - ground water
  - underground defects
  - earthquake
- economics

# Generalized Design Steps

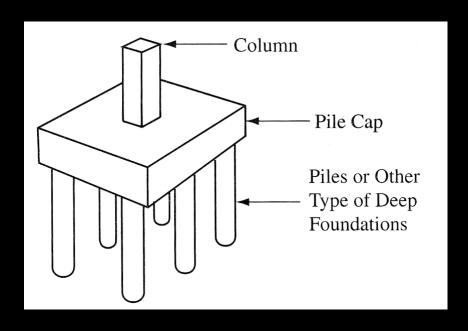

- calculate loads
- characterize soil
- determine footing location and depth
- evaluate soil bearing capacity
- determine footing size (unfactored loads)
- calculate contact pressure and check stability
- estimate settlements
- design footing structure\* (factored loads)

# Types of Foundations

- spread footings
- wall footings
- eccentric footings
- combined footings
- unsymmetrical footings
- strap footings

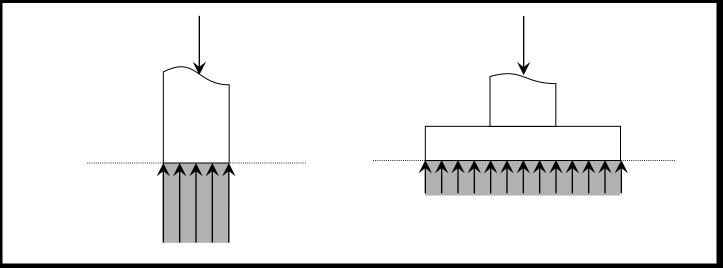

# Types of Foundations

- mat foundations
- retaining walls
- basement walls
- pile foundations
- drilled piers

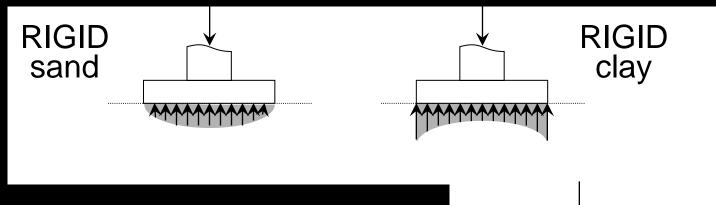

# Shallow Footings

- spread footing
  - a square or rectangular footing supporting a single column
  - reduces stress from load to size the ground can withstand

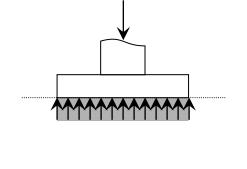

# Actual vs. Design Soil Pressure

- stress distribution is a function of
  - footing rigidity
  - soil behavior

 linear stress distribution assumed

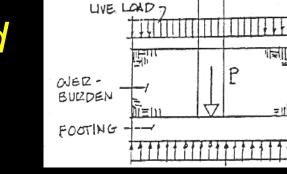

# Proportioning Footings

net allowable soil pressure, q<sub>net</sub>

$$-q_{net} = q_{allowable} - h_f(\gamma_c - \gamma_s)$$

- considers all extra weight (overburden) from replacing soil with concrete
- can be more overburden
- design requirement with total unfactored load:

COLUMN

+ (IHI)

D (FT)

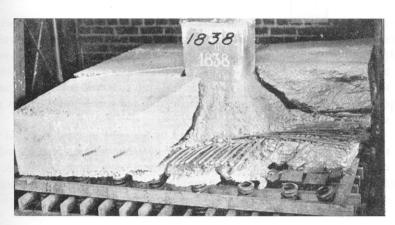

h<sub>f</sub> (IH)

## Concrete Spread Footings

- plain or reinforced
- ACI specifications
- P<sub>II</sub> = combination of factored D, L, W
- ultimate strength
  - $-V_{\mu} \leq \phi V_{c}$ :  $\phi = 0.75$  for shear
    - plain concrete has shear strength
  - $-M_{IJ} \leq \phi M_{D}$ :  $\phi = 0.9$  for flexure

# Concrete Spread Footings

### failure modes

**Figure 9.2** "Shear" failure in a spread footing loaded in a laboratory (Talbot, 1913). Observe how this failure actually is a combination of tension and shear.

#### shear

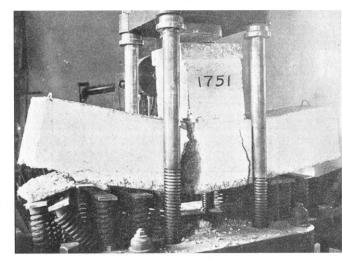

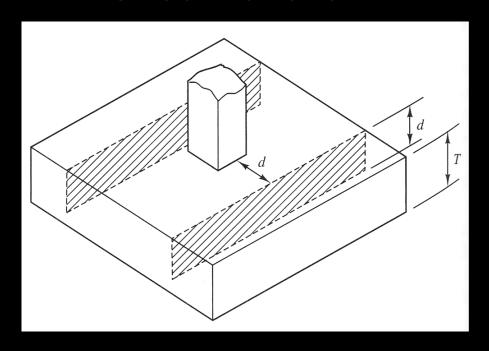

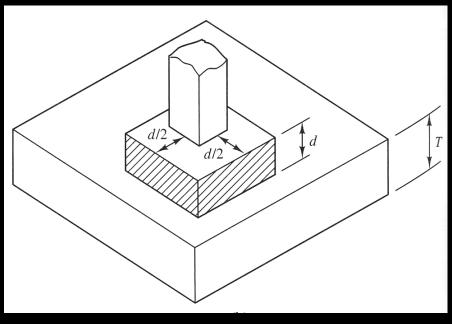

Figure 9.3 Flexural failure in a spread footing loaded in a laboratory (Talbot, 1913).

bending

# Concrete Spread Footings

shear failure

one way shear

two way shear

### Over and Under-reinforcement

reinforcement ratio for bending

$$-\rho = \frac{A_s}{bd}$$

- $-\rho = \frac{A_s}{bd}$   $use as a design estimate to find A_s,b,d$
- − max  $\rho$  from  $\varepsilon_{\text{steel}} \ge 0.004$
- minimum for slabs & footings of uniform thickness  $\frac{A_s}{}=0.002$  grade 40/50 bars =0.0018 grade 60 bars

# Reinforcement Length

- need length, l<sub>d</sub>
  - bond
  - development of yield strength

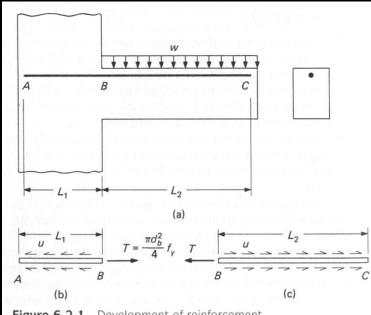

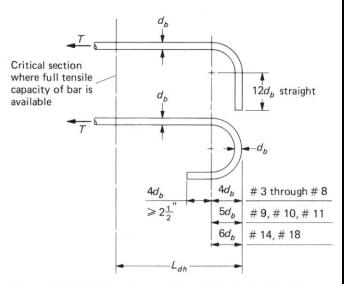

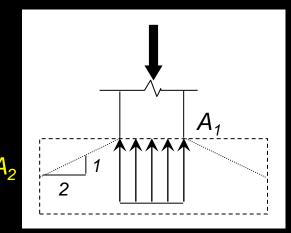

Figure 6.2.1 Development of reinforcement.

**Figure 6.11.2** Development length  $L_{dh}$  for hooked bar.

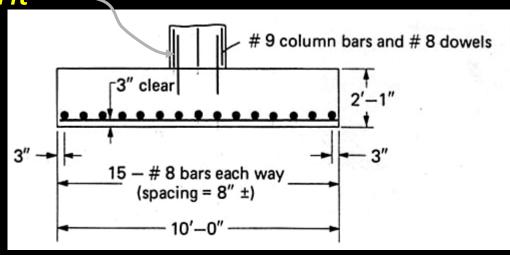

### Column Connection

- bearing of column on footing
  - $-P_u \le \phi P_n = \phi (0.85 f_c' A_1)$  $\phi = 0.65 \text{ for bearing}$
  - confined: increase x

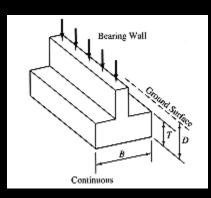

· dowel reinforcement

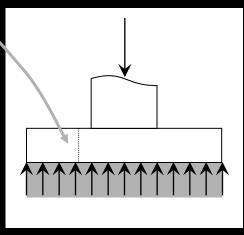

- if  $P_u > P_b$ , need compression reinforcement
- min of 4 #5 bars(or 15 metric)

## Wall Footings

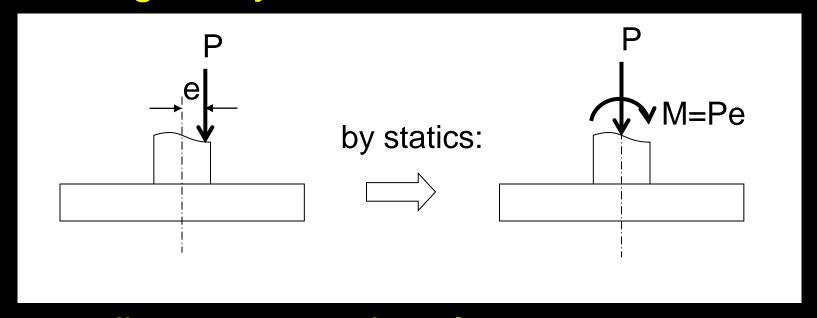

- continuous strip for load bearing walls
- plain or reinforced
- behavior
  - wide beam shear
  - bending of projection
- dimensions usually dictated
   by codes for residential walls
- light loads

## Eccentrically Loaded Footings

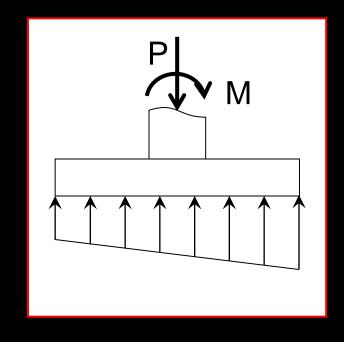

footings subject to moments

soil pressure resultant force <u>may not</u>
 <u>coincide</u> with the centroid of the footing

### Differential Soil Pressure

- to avoid large rotations,
   limit the differential soil
   pressure across footing
- for rigid footing,
  simplification of soil
  pressure is a linear
  distribution based on
  constant ratio of pressure to settlement

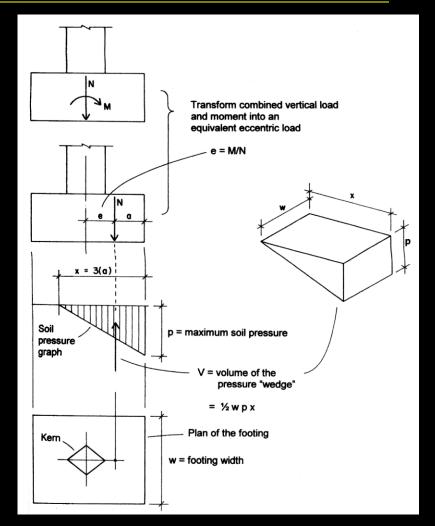

### Kern Limit

- boundary of e for no tensile stress
- triangular stress block with  $p_{max}$

$$volume = \frac{wpx}{2} = N$$

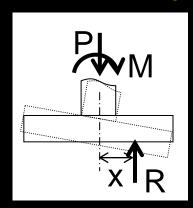

$$p_{\text{max}} = \frac{2N}{N}$$

### Guidelines

- want resultant of load from pressure inside the middle third of base (kern)
  - ensures stability with respect to overturning

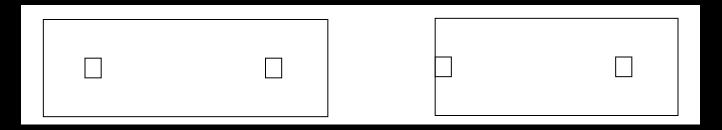

$$SF = \frac{M_{resist}}{M_{overturning}} = \frac{R \cdot x}{M} \ge 1.5$$

- pressure under toe (maximum)  $\leq q_a$
- shortcut using uniform soil pressure for design moments gives similar steel areas

## Combined Footings

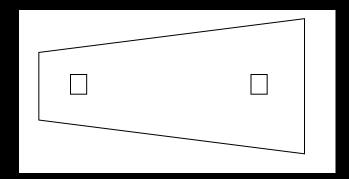

- supports two columns
- used when space is tight and spread footings would overlap or when at property line

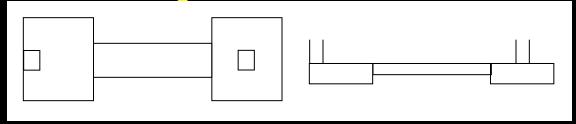

- soil pressure might not be uniform
- proportion so pressure will uniform for sustained loads
- behaves like beam lengthwise

## Combined Footing Types

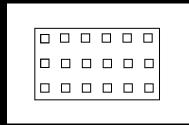

- rectangular
- trapezoid

- strap or cantilever
  - prevents overturning of exterior column

- raft/mat
  - more than two columns over an extended area

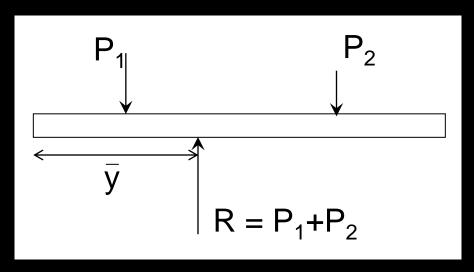

## **Proportioning**

- uniform settling is desired
- area is proportioned with sustained column loads
- want the resultant to coincide with <u>centroid</u> of footing area for uniformly distributed

pressure assuming a rigid footing

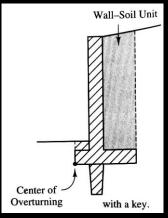

$$q_{max} \le q_a$$

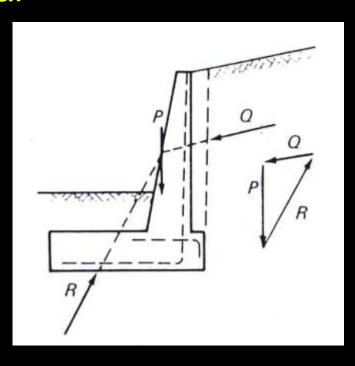

Architectural Structures
ARCH 331

# Retaining Walls

- purpose
  - retain soil or other material
- basic parts
  - wall & base
  - additional parts
    - counterfort
    - buttress
    - key

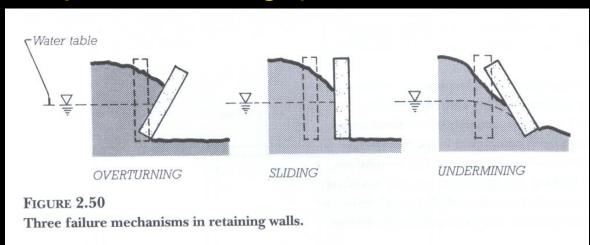

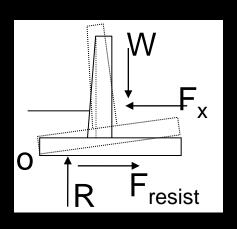

# Retaining Walls

- considerations
  - overturning
  - settlement
  - allowable bearing pressure
  - sliding
  - (adequate drainage)

# Retaining Walls

- procedure
  - proportion and check stability with working loads for bearing, <u>overturning</u> and <u>sliding</u>
  - design structure with factored loads

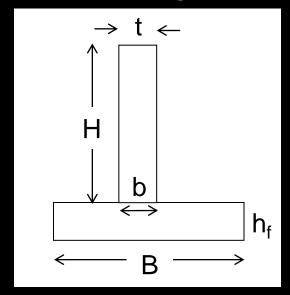

$$SF = \frac{M_{resist}}{M_{overturning}} \ge 1.5 - 2$$

$$SF = \frac{F_{horizontal-resist}}{F_{sliding}} \ge 1.25 - 2$$

# Retaining Wall Proportioning

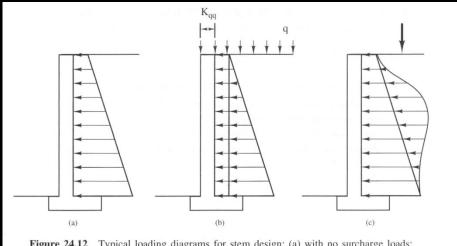

### estimate size

- footing size, B ≈ 2/5 2/3 wall height (H)
- footing thickness ≈ 1/12 1/8 footing size (B)
- base of stem  $\approx 1/10$  1/12 wall height (H+h<sub>f</sub>)
- *top of stem* ≥ 12"

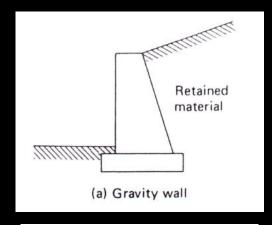

## Retaining Walls Forces

- design like cantilever beam
  - V<sub>II</sub> & M<sub>II</sub> for reinforced concrete
  - $-V_{\mu} \leq \phi V_{c}$ :  $\phi = 0.75$  for shear
  - $-M_{u} \leq \phi M_{n}$ :  $\phi = 0.9$  for flexure

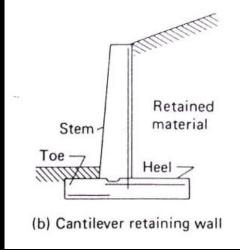

# Retaining Wall Types

- "gravity" wall
  - usually unreinforced
  - economical & simple

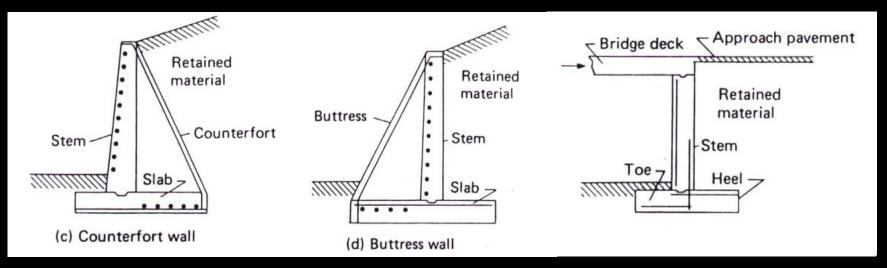

- cantilever retaining wall
  - common

# Retaining Wall Types

- counterfort wall
- buttress wall

- very tall walls (> 20 25 ft)
- bridge abutment
- basement frame wall (large basement areas)

#### Deep Foundations

- usage
  - when spread footings, mats won't work
  - when they are required to transfer the structural loads to good bearing material
  - to resist uplift or overturning
  - to compact soil
  - to control settlements of spread or mat foundations

# Deep Foundation Types

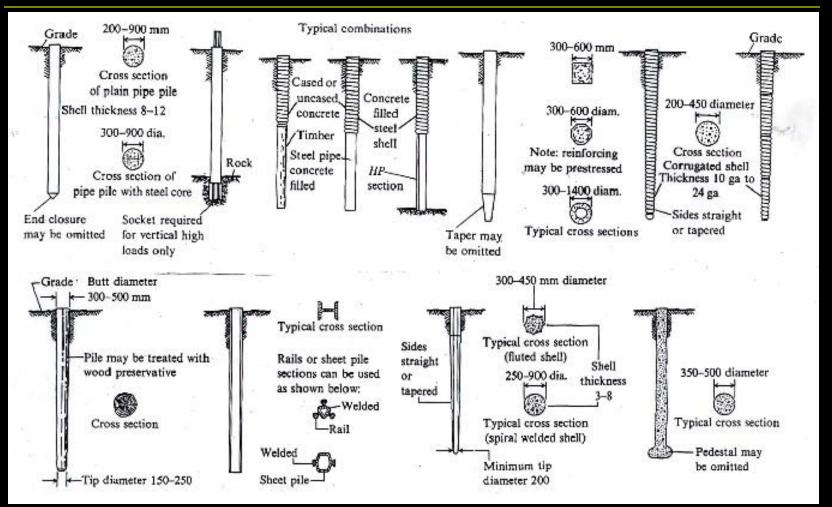

- piles usually driven, 6"-8"  $\phi$ , 5' +
- piers
- caissons
- drilled shafts
- bored piles

drilled, excavated, concreted (with or without steel)

2.5' - 10'/12' $\phi$ 

pressure injected piles

# Deep Foundation Types

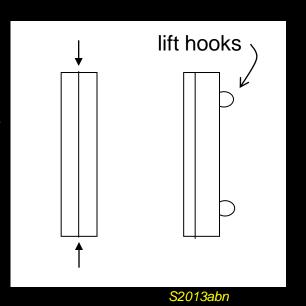

### Deep Foundations

- classification
  - by material
  - by shape
  - by function (structural, compaction...)
- pile placement methods
  - driving with pile hammer (noise & vibration)
  - driving with vibration (quieter)
  - jacking
  - drilling hole & filling with pile or concrete

# Piles Classified By Material

- timber
  - use for temporary construction
  - to densify loose sands
  - embankments
  - fenders, dolphins (marine)
- concrete
  - precast: ordinary reinforcement or prestressed
  - designed for axial capacity and bending with handling

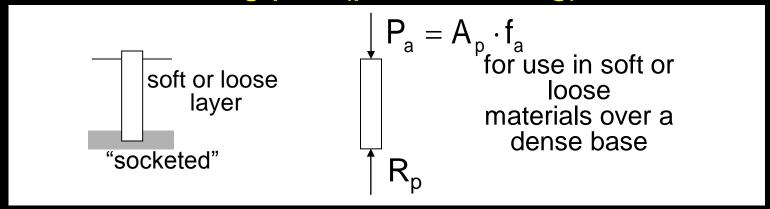

## Piles Classified By Material

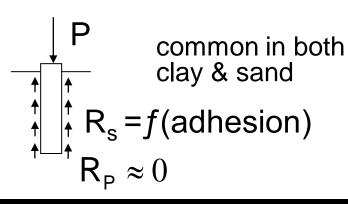

- steel
  - rolled HP shapes or pipes
  - pipes may be filled with concrete
  - HP displaces little soil and may either break small boulders or displace them to the side

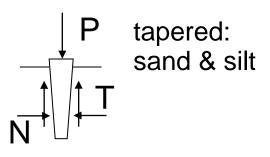

## Piles Classified By Function

#### – end bearing pile (point bearing)

#### friction piles (floating)

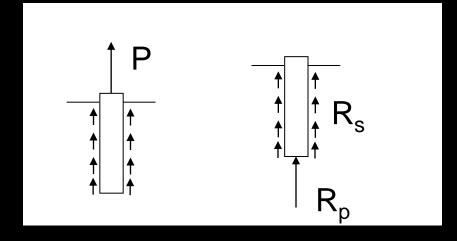

# Piles Classified By Function

- combination friction and end bearing

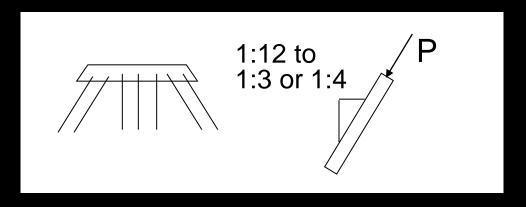

uplift/tension piles
 structures that float,

batter piles

towers

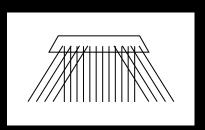

angled, cost more, resist large horizontal loads

## Piles Classified By Function

- fender piles, dolphins, pile clusters

large # of piles in a small area

- compaction piles
  - used to densify loose sands
- drilled piers
  - eliminate need for pile caps
  - designed for bearing capacity (not slender)

## Pile Caps and Grade Beams

- like multiple column footing
- more shear areas to consider
